

Headers

While you can setup all the labs and exercises throughout the course in this way, as opposed to some other IDE's like Dev-C++ the method we have covered so far will lead to some warnings. To resolve these properly, we need to include a header.

Create a new header file:

Go to Project – Add New Item

Choose Header File and name it main.h

Select main.h and paste the following code:

```
#include <stdio.h>
#include <stdlib.h>
```

Modify your main.c file so that it looks like the following:

```
#include "main.h"

extern int Exercise1();
extern int Exercise2();

int main(int argc, char *argv[])
{
    printf("\nHello World \n");

    Exercise1();
    Exercise2();

    system("PAUSE");
    return 0;
}
```

Add #include "main.h" to the top of both Lab1Ex1.c and Lab1.Ex2.c

Recompile your program and the warnings should be gone

Note: Including a header file is similar to copying the content of the header file's contents into the source file. A simple practice in C or C++ programs is that we keep all the constants, macros, system wide global variables, and function prototypes in header files and include that header file wherever it is required. We will look at header files in more detail over the course of the module.

Visual Studio Guide Manual:

Verifpal User Manual Nadim Kobeissi, 2020-03-02 The security of cryptographic protocols remains as relevant as ever with systems such as TLS and Signal being responsible for much of the Web's security guarantees. One main venue for the analysis and verification of these protocols has been automated analysis with formal verification tools such as ProVerif, CryptoVerif and Tamarin. Indeed, these tools have led to confirming security guarantees as well as finding attacks in secure channel protocols including TLS and Signal. However, formal verification in general has not managed to significantly attract a wider audience. Verifpal is new software for verifying the security of cryptographic protocols. Building upon contemporary research in symbolic formal verification, Verifpal's main aim is to appeal more to real-world practitioners, students and engineers without sacrificing comprehensive formal verification features. In order to achieve this, Verifpal introduces a new intuitive language for modeling protocols that is much easier to write and understand than the languages employed by existing tools. At the same time, Verifpal is able to model protocols under an active attacker with unbounded sessions and fresh values and supports queries for advanced security properties such as forward secrecy or key compromise impersonation. Verifpal has already been used to verify security properties for Signal, Scuttlebutt, TLS 1.3, Telegram and other protocols. It is a community-focused project and available under a GPLv3 license. The Verifpal language is meant to illustrate protocols close to how one may describe them in an informal conversation while still being precise and expressive enough for formal modeling. Verifpal reasons about the protocol model with explicit principals Alice and Bob exist and have independent states. Easy to Understand Analysis Output When a contradiction is found for a query, the result is related in a readable format that ties the attack to a real-world scenario. This is done by using terminology to indicate how the attack could have been possible, such as through a man-in-the-middle on ephemeral keys. Friendly and Integrated Software Verifpal comes with a Visual Studio Code extension that offers syntax highlighting and soon live query verification within Visual Studio Code, allowing developers to obtain insights on their model as they are writing it.
