for Regeneration Francisco J. Rivera, Ludwig Aigner, 2018-03-13 Tissues and organs have although sometimes limited the capacity for endogenous repair which is aimed to re establish integrity and homeostasis Tissue repair involves pro and anti inflammatory processes new tissue formation and remodelling Depending on the local microenvironment tissue repair results either in scar tissue formation or in regeneration The latter aims to recapitulate the original tissue structure and architecture with the proper functionality Although some organisms such as planarians have a high regenerative capacity throughout the body in humans this property is more restricted to a few organs and tissues Regeneration in the adult is possible in particular through the existence of tissue resident pools of stem progenitor cells In response to tissue damage these cells are activated they proliferate and migrate and differentiate into mature cells Angiogenesis and neovascularization play a crucial role in tissue repair Besides providing with oxygen and nutrients angiogenesis generates a vascular niche VN consisting of different blood derived elements and endothelial cells surrounded by basement membrane as well as perivascular cells The newly generated VN communicates with the local stem progenitor cells and contributes to tissue repair For example platelets macrophages neutrophils perivascular cells and other VN components actively participate in the repair of skin bone muscle tendon brain spinal cord etc Despite these observations the exact role of the VN in tissue repair and the underlying mechanisms are still unclear and are awaiting further evidence that indeed will be required for the development of regenerative therapies for the treatment of traumatic injuries as well as degenerative diseases **Selected Water**

Fish Sense (Picador Shorts) Jonathan Balcombe, 2025-06-10 A quirky intimate and eye opening look into the ways of thinking like a fish An extract from the much loved modern classic on the subject of fish consciousness What a Fish Knows Do fishes think Do they really have three second memories And can they recognize the humans who peer back at them from above the surface of the water Jonathan Balcombe dives in among our marine cousins to explore the essential questions of how fish perceive and process the world With his ethologist s gift for showing us the hidden depths of questions we ve routinely preferred to think of as simple and his raconteur s flair for the surprising and the curious

Balcombe takes us under the sea through streams and estuaries and to the other side of the aquarium glass to reveal the surprising capabilities of fishes Balcombe upends our assumptions about fishes portraying them not as unfeeling dead eyed feeding machines but as sentient aware social and even Machiavellian in other words much like us Using humor and a repertoire of some of the most surprising fish facts you ve ever heard Balcombe shakes up what you think you know about what s going on inside the mind of these denizens of the deep Fish Sense is part of the Picador Shorts series Oceans Rivers and Streams in which excerpts from beloved classics speak to our relationship with our water bodies great and small

Wolf,2016-08-08 Throughout their lifetime animals learn to associate stimuli with their consequences Following memory acquisition and consolidation circumstances may arise that necessitate that initially learned behaviour is no longer relevant The ensuing process is called extinction learning and involves a novel and complex learning procedure that involves a large number of neural entities While the neural fundamentals of the initial acquisition are well studied our understanding of the behavioural and neural basis of extinction is still limited and derives mostly from rodent data acquired through fear conditioning paradigms Fear conditioning and extinction in rodents is a spectacularly successful paradigm within behavioral neuroscience However in recent years new approaches have been emerging that examine the mechanisms of extinction learning in different setting that also involve appetitive models a broader comparative perspective a focus on other brain systems an examination of hormonal factors and conditioning of immune responses Only a broader analysis of the neural fundamentals of extinction learning will finally uncover shared and distinct mechanisms that underlie extinction learning in different functional systems

The papers compiled in this Research Topic offer new and valuable insights into the mechanisms and functional implementation of extinction learning at its different levels of complexity and form the basis for new concepts and research ideas in this field
