Dynamical System Models In The Life Sciences And Their Underlying Scientific Issues Frederic Y M Wan, 2017-08-16 Broadly speaking there are two general approaches to teaching mathematical modeling 1 the case study approach and 2 the method based approach that teaches mathematical techniques with applications to relevant mathematical models This text emphasizes instead the scientific issues for modeling different phenomena For the natural or harvested growth of a fish population we may be interested in the evolution of the population whether it reaches a steady state equilibrium or cycle stable or unstable with respect to a small perturbation from equilibrium or whether a small change in the environment would cause a catastrophic change etc Each scientific issue requires an appropriate model and a different set of mathematical tools to extract information from the model Models examined are chosen to help explain or justify empirical observations such as cocktail drug treatments are more effective and regenerations after injuries or illness are fast tracked compared to original developments Volume I of this three volume set limits its scope to phenomena and scientific issues that are modeled by ordinary differential equations ODE Scientific issues such as signal and wave propagation diffusion and shock formation involving spatial dynamics to be modeled by partial differential equations PDE will be treated in Vol II Scientific issues involving randomness and uncertainty are examined in Vol III

Applied Statistical Methods in Agriculture, Health and Life Sciences Bayo Lawal, 2014-09-15. This textbook teaches crucial statistical methods to answer research questions using a unique range of statistical software programs including MINITAB and R. This textbook is developed for undergraduate students in agriculture, nursing, biology and biomedical research. Graduate students will also find it to be a useful way to refresh their statistics skills and to reference software options. The unique combination of examples is approached using MINITAB and R for their individual strengths. Subjects covered include, among others, data description, probability distributions, experimental design, regression analysis, randomized design and biological assay. Unlike other biostatistics textbooks, this text also includes outliers, influential observations in regression and an introduction to survival analysis. Material is taken from the author's extensive teaching and research in Africa, USA and the UK. Sample problems, references and electronic supplementary material accompany each chapter.
