Zhu,2011-10-26 The purpose of this book is to introduce researchers and graduate students to a broad range of applications of computational simulations with a particular emphasis on those involving computational fluid dynamics CFD simulations. The book is divided into three parts. Part I covers some basic research topics and development in numerical algorithms for CFD simulations including Reynolds stress transport modeling, central difference schemes for convection diffusion equations, and flow simulations involving simple geometries such as a flat plate or a vertical channel. Part II covers a variety of important applications in which CFD simulations play a crucial role, including combustion process and automobile engine design, fluid heat exchange, airborne contaminant dispersion over buildings, and atmospheric flow around a re entry capsule, gas solid two phase flow in long pipes, free surface flow around a ship hull, and hydrodynamic analysis of electrochemical cells. Part III covers applications of non CFD based computational simulations including atmospheric optical communications, climate system simulations, porous media flow, combustion, solidification, and sound field simulations for optimal acoustic effects.
