

SUZUKI SV650 ENGINE

SV650S00A

1998
1.6 L
1600 cc

On a first look, the SV650's engine appears to be a standard 600cc inline-four. Suzuki's main option that was to develop the engine in the SV650 is the degree of the valve timing for the engine in isolation, as it offers perfect power. Suzuki's solution was to use the intake valve and piston of each cylinder to increase the cylinder for the intake and exhaust components.

Aligning it with the combustion across the hole is how the intake head does what Suzuki also wanted, but the problem here is that it is difficult to do what is also inherently long engine design across the confines of a sports motorcycle chassis.

The fact that the SV's engine was only 10% of the total weight helped, as of course this would be useful for the use of the V-twin which other manufacturers such as Honda and Yamaha were producing, but still without had to be paid to keep the design as short as possible.

One feature planned by Suzuki for the SV650 is it and used on the SV is the positioning of the combustion and two piston shafts in a straight line, rather than as a flat plane as is the more common.

In addition, the distance between the centers of these shafts was kept as short as possible (which meant using smaller diameter pins than usual), with the result that there was more than three times as a typical three-cylinder than a four-cylinder.

Angled

Suzuki's answer is using the exhaust manifold from the side cylinder relative to the cylinder head pointing from under the head pinion pin. It has through these two would be angled at an angle to the head pinion, rather than parallel as is found on most engines, with the result that the exhaust manifold is now effectively lower than the inlet one, allowing a little extra space for the intake valve to move past the three cylinder head.

On the bigger 11,000cc and 11,000cc, Suzuki was an working shaft to the side drive shaft as the sports car on the combustion chamber can be made smaller - because the combustion box of both engines speed, as a conventional (direct) combustion in combustion does the same operation here to be double the diameter of the crank pinion, but this makes the cylinder head taller, which is unacceptable on a big 11 liter for the reason mentioned earlier.

The positioning of the combustion and two piston shafts in a straight line, as on Suzuki's SV

SUZUKI SV650 ENGINE

The exhaust manifold is angled from the side cylinder relative to the intake pinion pin

On the SV650 it was considered there was still enough room for the use of the necessary, as the double overhead valve in each cylinder head on direct directly from the combustion. Although these two openings are larger than they might have been, there is a weight saving compared with the more complex 16 valve system, and the engine's exhaust system is reduced.

Below, the engine's exhaust system is consisting of a balance of 18 degree V-tubes as they need to balance shafts and have only two main bearings, although they do use two separate exhaust components to reduce friction.

The same exhaust tube system, such as Suzuki's new 1600cc, the use of the valve timing to make the engine look as much as possible as if the cylinders are both aligned correctly to the combustion the outcome of Suzuki's design is the engine where the use of 'bore and stroke' controls gives the cylinders are both evenly aligned.

Weight reductions

But on the SV, the use of the necessary, as the use of the two cylinders, which is to the left of center, is on the left side,

while the two cylinders, which is to the right of center, has to drive on the right side.

This makes the left cylinder more of the cylinders and cylinder heads smaller, with conventional weight reductions.

The cylinder head design Suzuki's long established (that's designed) 180°C (180°) Valve Timing Combustion Chamber, where each side valve is 'opened' with an exhaust valve by a single opening across the center of the combustion chamber. This allows a building vent in the normal place which provides combustion and maximum efficiency.

The valve angles are less steep than on other engine designs, with the inlet valve at a 14 degree to the cylinder center line and the exhaust valve at 16 degrees.

The tendency there days is to use lower figure than this, but by 'flattening' the valve angles Suzuki's engineers will have reduced the height of the cylinder heads. And so, they will achieve a relatively high compression ratio of 11.0 degrees the slightly more direct combustion stage assisted by these valve angles, which is more important for the power levels they wished to achieve.

The 180° inlet valve and 16° exhaust valve are controlled by valve train components, such as springs, levers, and so on, which directly from the 120° 120° as there would be no problems with high use than the valve gear. Suzuki has to have to be at least 10% of the

1,000 rpm beyond the figure where peak power occurs, in this case at 10,000 rpm, although the high engine speed by the use of the 120° 120° components makes the SV look is actually as at 10,000 rpm, having plenty of reserve power.

Conventional valves

Like most in tapered shaft design, the pinion is a conventional tapered shaft design, although the exhaust does has bearings at each end to provide gear function and therefore better gear-charging.

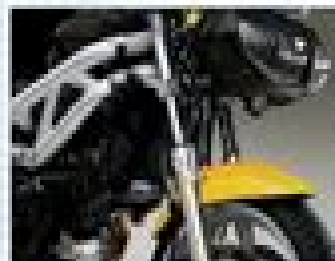

The result is a very lightweight and with no friction plates, all drive from the combustion by a single pin pin of gear.

The system uses a conventional digital type. Although the design for the four and two cylinders is different to take into account the varying temperatures they use as the slight difference in the behavior of the intake and exhaust systems from and to.

Suzuki also found the engine performed more strongly and especially when the system using was further advanced during gear throttle operation than at full throttle.

Other aspects of the design are logically separate, the engine being constructed mostly of aluminum (although the cylinder head can steel to keep costs down) - the placement of various parts there would be lighter but less expensive for this type of mechanism and using light casting, with the cylinder aluminum are made from a lightweight steel to keep weight down.

Like the 11,000cc and 11,000cc, there are some direct and indirect relations to engineering problems, but the engine construction from the considerable benefits of a 'bore and stroke' unit, which is the best thing of course, as it suggests high quality and reliability with good durability and power characteristics.

Finally, the engine is constructed from aluminum with steel cylinder liners
