Study Guide, definitions & note

Cell Cycle

A cell cycle is a series of events that takes place in a cell as it grows and divides. A cell spends most of its time in what is called interphase, and during this time it grows, replicates its chromosomes, and prepares for cell division. The cell then leaves interphase, undergoes mitosis, and completes its division.

Rudolf Virchow - "Omnis cellula e cellula"

In 1855, at the age of 34, he published his now famous aphorism "omnis cellula e cellula" ("every cell stems from another cell"). With this approach Virchow launched the field of cellular pathology. He stated that all diseases involve changes in normal cells, that is, all pathology ultimately is cellular pathology.

THE KEY ROLES OF CELL DIVISION

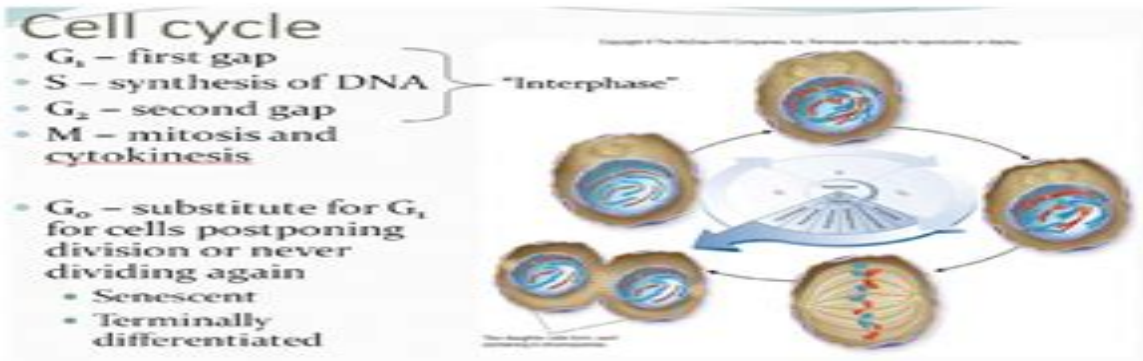

Cell division functions in reproduction, growth, and repair

- involves the distribution of identical genetic material to two daughter cells

Cell division distributes identical sets of chromosomes to daughter cells

- **genome** - genetic material of an organism
- replication and distribution is manageable because DNA are packaged into **chromosomes**
- **somatic cells** - all body cells except reproductive cells (46 chromosomes - humans)
- **gametes** - reproductive cells; sperm or egg cell (23 chromosomes - humans)
- **chromatin** - DNA-protein complex; uncondensed chromosome
- **sister chromatids** - contains identical copies of the chromosome's DNA molecule (letter V)
- **centromere** - region that joins two sister chromatids
- **mitosis** - division of the nucleus
- **cytokinesis** - division of the cytoplasm
- **meiosis** - yields daughter cells that have half as many chromosomes as the parent cell

● Cell Cycle

● **G1 Phase**

● Gap Phase

- Manufacturing and activating enzymes for cell cycle
- Committed step-checkpoint
 - Cell is committed to enter S phase

● **S Phase**

- Synthesis of DNA
