Collision Documentation Christopher D Armstrong, 2018-11-02 The last ten years have seen explosive growth in the technology available to the collision analyst changing the way reconstruction is practiced in fundamental ways The greatest technological advances for the crash reconstruction community have come in the realms of photogrammetry and digital media analysis The widespread use of scanning technology has facilitated the implementation of powerful new tools to digitize forensic data create 3D models and visualize and analyze crash vehicles and environments The introduction of unmanned aerial systems and standardization of crash data recorders to the crash reconstruction community have enhanced the ability of a crash analyst to visualize and model the components of a crash reconstruction Because of the technological changes occurring in the industry many SAE papers have been written to address the validation and use of new tools for collision reconstruction Collision Reconstruction Methodologies Volumes 1 12 bring together seminal SAE technical papers surrounding advancements in the crash reconstruction field Topics featured in the series include Night Vision Study and Photogrammetry Vehicle Event Data Recorders Motorcycle Heavy Vehicle Bicycle and Pedestrian Accident Reconstruction The goal is to provide the latest technologies and methodologies being introduced into collision reconstruction appealing to crash analysts consultants and safety engineers alike [Click here to purchase the entire set at a discount](#)

Channel-conveyance capacity, channel change, and sediment transport in the lower Puyallup, White, and Carbon Rivers, western Washington Jonathan A. Czuba, Christiana R. Czuba, Christopher S. Magirl, Frank D. Voss, 2010-12-01 Draining the volcanic glaciated terrain of Mount Rainier Washington the Puyallup White and Carbon Rivers convey copious volumes of water and sediment down to Commencement Bay in Puget Sound Recent flooding in the lowland river system has renewed interest in understanding sediment transport and its effects on flow conveyance throughout the lower drainage basin Bathymetric and topographic data for 156 cross sections were surveyed in the lower Puyallup River system by the U S Geological Survey USGS and were compared with similar datasets collected in 1984 Regions of significant aggradation were measured along the Puyallup and White Rivers Between 1984 and 2009 aggradation totals as measured by changes in average channel elevation were as much as 7 5 6 5 and 2 feet on the Puyallup White and Carbon Rivers respectively These aggrading river sections correlated with decreasing slopes in riverbeds where the rivers exit relatively confined sections in the upper drainage and enter the relatively unconstricted valleys of the low gradient Puget Lowland Measured grain size distributions from each riverbed showed a progressive fining downstream Analysis of stage discharge relations at streamflow gaging stations along rivers draining Mount Rainier demonstrated the dynamic nature of channel morphology on river courses influenced by glaciated volcanic terrain The greatest rates of aggradation since the 1980s were in the Nisqually River near National 5 0 inches per year and the White River near Auburn 1 8 inches per year Less pronounced aggradation was measured on the Puyallup River and the White River just downstream of Mud Mountain Dam The largest measured rate

of incision was measured in the Cowlitz River at Packwood 50 inches per year Channel conveyance capacity estimated using a one dimensional hydraulic model decreased in some river reaches since 1984 The reach exhibiting the largest decrease about 20-50 percent in channel conveyance capacity was the White River between R Street Bridge and the Lake Tapps return a reach affected by recent flooding Conveyance capacity also decreased in sections of the Puyallup River Conveyance capacity was mostly unchanged along other study reaches Bedload transport was simulated throughout the entire river network and consistent with other observations and analyses the hydraulic model showed that the upper Puyallup and White Rivers tended to accumulate sediment Accuracy of the bedload transport modeling however was limited due to a scarcity of sediment transport data sets from the Puyallup system mantling of sand over cobbles in the lower Puyallup and White Rivers and overall uncertainty in modeling sediment transport in gravel bedded rivers Consequently the output results from the model were treated as more qualitative in value useful in comparing geomorphic trends within different river reaches but not accurate in producing precise predictions of mass of sediment moved or deposited The hydraulic model and the bedload transport component were useful for analyzing proposed river management options if surveyed cross sections adequately represented the river management site and proposed management options The hydraulic model showed that setback levees would provide greater flood protection than gravel bar scalping after the initial project construction and for some time thereafter although the model was not accurate enough to quantify the length of time of the flood protection The greatest hydraulic benefit from setback levees would be a substantial increase in the effective channel conveyance area By widening the distance between levees the new floodplain would accommodate larger increases in discharge with relatively small incremental increases in stage Model simulation results indicate that the hydraulic benefit from a setback levee also would be long lived and would effectively compensate for increased deposition within the setback reach from increased channel conveyance capacity In contrast the benefit from gravel bar scalping would be limited by the volume of material that could be removed and the underlying hydraulics in the river section that would be mostly unaffected by scalping Finally the study formulated an explanation of the flooding that affected Pacific Washington in January 2009 Reduction in channel conveyance capacity of about 25 percent at the White River near Auburn streamflow gaging station between November 2008 and January 2009 was caused by rapid accumulation of coarse grained sediment just downstream of the gage continuing an ongoing trend of aggradation that has been documented repeatedly Public Works Manual, 2002 Crime Scene Documentation Robert Galvin, 2020-12-10 When a criminal act or vehicle crash occurs most often a local law enforcement agency responds and is responsible for both investigating the scene and for documenting it It is critical that scene evidence is collected and recorded efficiently as the scene can quickly change The sooner evidence can be collected reviewed and analyzed the better an understanding investigators will have as to how and why the incident occurred Crime Scene Documentation Preserving the evidence and the growing role of 3D laser scanning demonstrates at length the value of laser scanning through the use of

numerous case studies of investigators who have utilized various 3D technologies and laser scanning to document scenes. Thorough and accurate scene documentation is an essential function at a science and proves particularly valuable in courtroom presentations to help jurors understand a crime or accident's likely chain of events. The more advanced a scene documentation method is the better it can be utilized to capture details that will lead to optimal scene diagramming. Currently 3D laser scanning is the most advanced method of scene documentation available capturing detailed and realistic digital scans capturing scenes in their entirety and yielding a permanent representation of the scene for study and analysis at any time even years after a crime scene has vanished. The book explains current technology the latest advances and how to best utilize the technology. Case examples come from various applications from tools to programs can help crash scene investigators understand how scanning can improve scene documentation provide better and more evidence details and build more credible diagrams that possibly may be used in court presentations to help support a case.

Key Features Describes 3D scene recording methods in use and how well they work. Outlines the variables and inherent challenges associated with documenting crime and crash scenes. Illustrates the positive and dramatic impact of having a well documented scene particularly in the courtroom. Explores how 3D laser scanning has vastly changed the way and extent to which crime and crash scenes can be captured accurately and completely and subsequently analyzed. Explains how laser scanning is highly flexible and presents strategies to integrate it into other crime scene incident recording techniques and technologies.

Crime Scene Documentation details the many benefits of 3D laser scanning technology relative to its reliability and accuracy as well as the multiple case scenarios in which it can be used. The book serves as an invaluable resource to crime scene technicians investigators and reconstructionists on the best ways to document a crime or crash scene.

Photogrammetric Survey for the Recording and Documentation of Historic Buildings Efstratios Stylianidis, 2020-08-16 This book provides state of the art information on photogrammetry for cultural heritage exploring the problems and presenting solutions that are applicable under real world conditions and in various disciplines. Allowing readers to gain a basic understanding of cultural heritage documentation and practical image based modelling techniques it focuses on the use of photogrammetry to enhance the documentation of historic buildings in order to reflect the international trends and meet demands of the preservation community. Addressing heritage documentation from various perspectives the book will appeal students and researchers from engineering backgrounds as well as from the arts and humanities.
