Classical Electromagnetic Theory Jack Vanderlinde, 2004-10-13 This book is a self contained course in electromagnetic theory suitable for senior physics and electrical engineering students as well as graduate students whose past has not prepared them well for books such as Jackson or Landau and Lifschitz The text is liberally sprinkled with worked examples illustrating the application of the theory to various physical problems In this new edition I have endeavored to improve the accuracy and readability added and further clarified examples added sections on Schwarz Christoffel mappings and to make the book more self sufficient added an appendix on orthogonal function expansions and added the derivation of Bessel functions and Legendre polynomials as well as derivation of their generating functions The number of student exercises has been increased by 45 over the previous edition This book stresses the unity of electromagnetic theory with electric and magnetic fields developed in parallel SI units are used throughout and considerable use is made of tensor notation and the Levi Cevita symbol To more closely display the parallelism extensive use is made of the scalar magnetic potential particularly in dealing with the Laplace and Poisson equation 85 worked problems illustrate the theory Conformal mappings are dealt with in some detail Relevant mathematical material is provided in appendices For information regarding Solutions Manual please contact the author Jack Vanderlinde at jvd unbc.ca or see website www.unbc.ca/fredericton/science/physics/jvdl

Materials Interaction with Femtosecond Lasers Bernd Bauerhenne, 2021-10-25 This book presents a unified view of the response of materials as a result of femtosecond laser excitation introducing a general theory that captures both ultrashort time non thermal and long time thermal phenomena It includes a novel method for performing ultra large scale molecular dynamics simulations extending into experimental and technological spatial dimensions with ab initio precision For this it introduces a new class of interatomic potentials constructed from ab initio data with the help of a self learning algorithm and verified by direct comparison with experiments in two different materials the semiconductor silicon and the semimetal antimony In addition to a detailed description of the new concepts introduced as well as giving a timely

review of ultrafast phenomena the book provides a rigorous introduction to the field of laser matter interaction and ab initio description of solids delivering a complete and self contained examination of the topic from the very first principles It explains step by step from the basic physical principles the underlying concepts in quantum mechanics solid state physics thermodynamics statistical mechanics and electrodynamics introducing all necessary mathematical theorems as well as their proofs A collection of appendices provide the reader with an appropriate review of many fundamental mathematical concepts as well as important analytical and numerical parameters used in the simulations
