the Numerical Solution of Ill Posed Problems offers a self contained introduction to several of the most important practical computational methods that have been successfully applied to a wide range of ill posed problems The book examines the mollification method and its multiple applications when used as a space marching method These computations are compared with various other methods used to arrive at the same numerical results Of special interest is a novel treatment of the two dimensional inverse heat conduction problem on a bounded domain There is a strong emphasis on computation supplemented by numerous exercises examples and illustrations Unlike most books on ill posed problems this volume contains all the motivations proofs algorithms and exercises necessary to fully understand the subject Materials are presented in clear simple language to make the subject accessible to readers with little or no background in ill posed problems For nonmathematicians an overview of essential mathematical tools is contained in an appendix References at the end of each chapter are supplemented with comments by the author and a second appendix offers up to date citings of literature on the inverse heat conduction problem to aid readers in further research An excellent text for upper level undergraduate or first year graduate courses on computational methods for inverse ill posed problems this book will also serve as a valuable reference work for professionals interested in modeling inverse phenomena

**Applied Methods of Structural Reliability** Milík Tichý, 2012-12-06 A quarter of the century has elapsed since I gave my first course in structural reliability to graduate students at the University of Waterloo in Canada Since that time on I have given many courses and seminars to students researchers designers and site engineers interested in reliability I also participated in and was responsible for numerous projects where reliability solutions were required During that period the scope of structural reliability gradually enlarged to become a substantial part of the general reliability theory First it is apparent that bearing structures should not be isolated objectives of interest and consequently that constntCted facilities should be studied Second a new engineering branch has emerged reliability engineering These two facts have highlighted new aspects and asked for new approaches to the theory and applications I always state in my lectures that the reliability theory is nothing more than mathematized engineering judgment In fact thanks mainly to probability and statistics and also to computers the empirical knowledge gained by Humankind s construction experience could have been transposed into a pattern of logic thinking able to produce conclusions and to forecast the behavior of engineering entities This manner of thinking has developed into an intricate network linked by certain rules which in a way can be considered a type of reliability grammar We can discern many grammatical concepts in the general structure of the reliability theory
