

■ The Suzuki Katana is an original term. It takes some getting used to, the radical styling, the humpback tank, the two-tier seat, the clip-on handlebars, the instant leverage. In the race of Japanese motorcycles, leading the U.S., the original 1987 Katana looked different and functioned more like an ex-

otic Italian sports bike than a product of industrial Japan. The Katana made its entrance in middle-of-the-road and changed the rules: increased in comfortable seating and compliant suspension, its wild looks, its wind-cutting aerodynamics (which gave it, despite just 190cc, the highest full-mile speed of any stock motorcycle tested by Cycle World in 1987) appeared to herald a new performance era.

Why a 1988 Katana? Because at the time the Katana was developed, Suzuki's

latest 107-hp four-valve-per-cylinder engine—built for the 1984 1000—was too big for AMA Superbike and racing championship endurance races. Suzuki in those events used an older, 99-hp two-valve-per-cylinder engine.

Suzuki engineers were certain that race engines based on the newer four-valve design would make more power, and were eager to get them on the racetrack. On the other hand, more people bought 1000cc street motorcycles than bought 1000cc race motorcycles. The

solution was to reduce the bore of the 107-hp four-valve engine and install it in the limited-production, 999cc GSX1000S Katana.

AMA rules for 1983 limit Superbikes to 750cc, and endurance rules are scheduled to follow the move to less displacement. The rule change makes the distinction between 107-hp and 100-hp a moot point, and the 1983 Katana has the biggest engine and the most aggressive GSX1000S.

The engine is the same as well in other

1983 four-valve Suzuki 1000s, with more power than 1981 and 1982 versions of the engine.

Bore and stroke are still 72 x 58 mm (the GSX1000S Katana's bore was 68 mm), and the engine still features 184°C (Four-Stroke Combustion Chamber), a design characterized by an intake and leanest and port run metal by Suzuki 184°C, divides the combustion chamber down into two sliding sections with a shallow ridge running down the middle, front to rear. Each half of the chamber

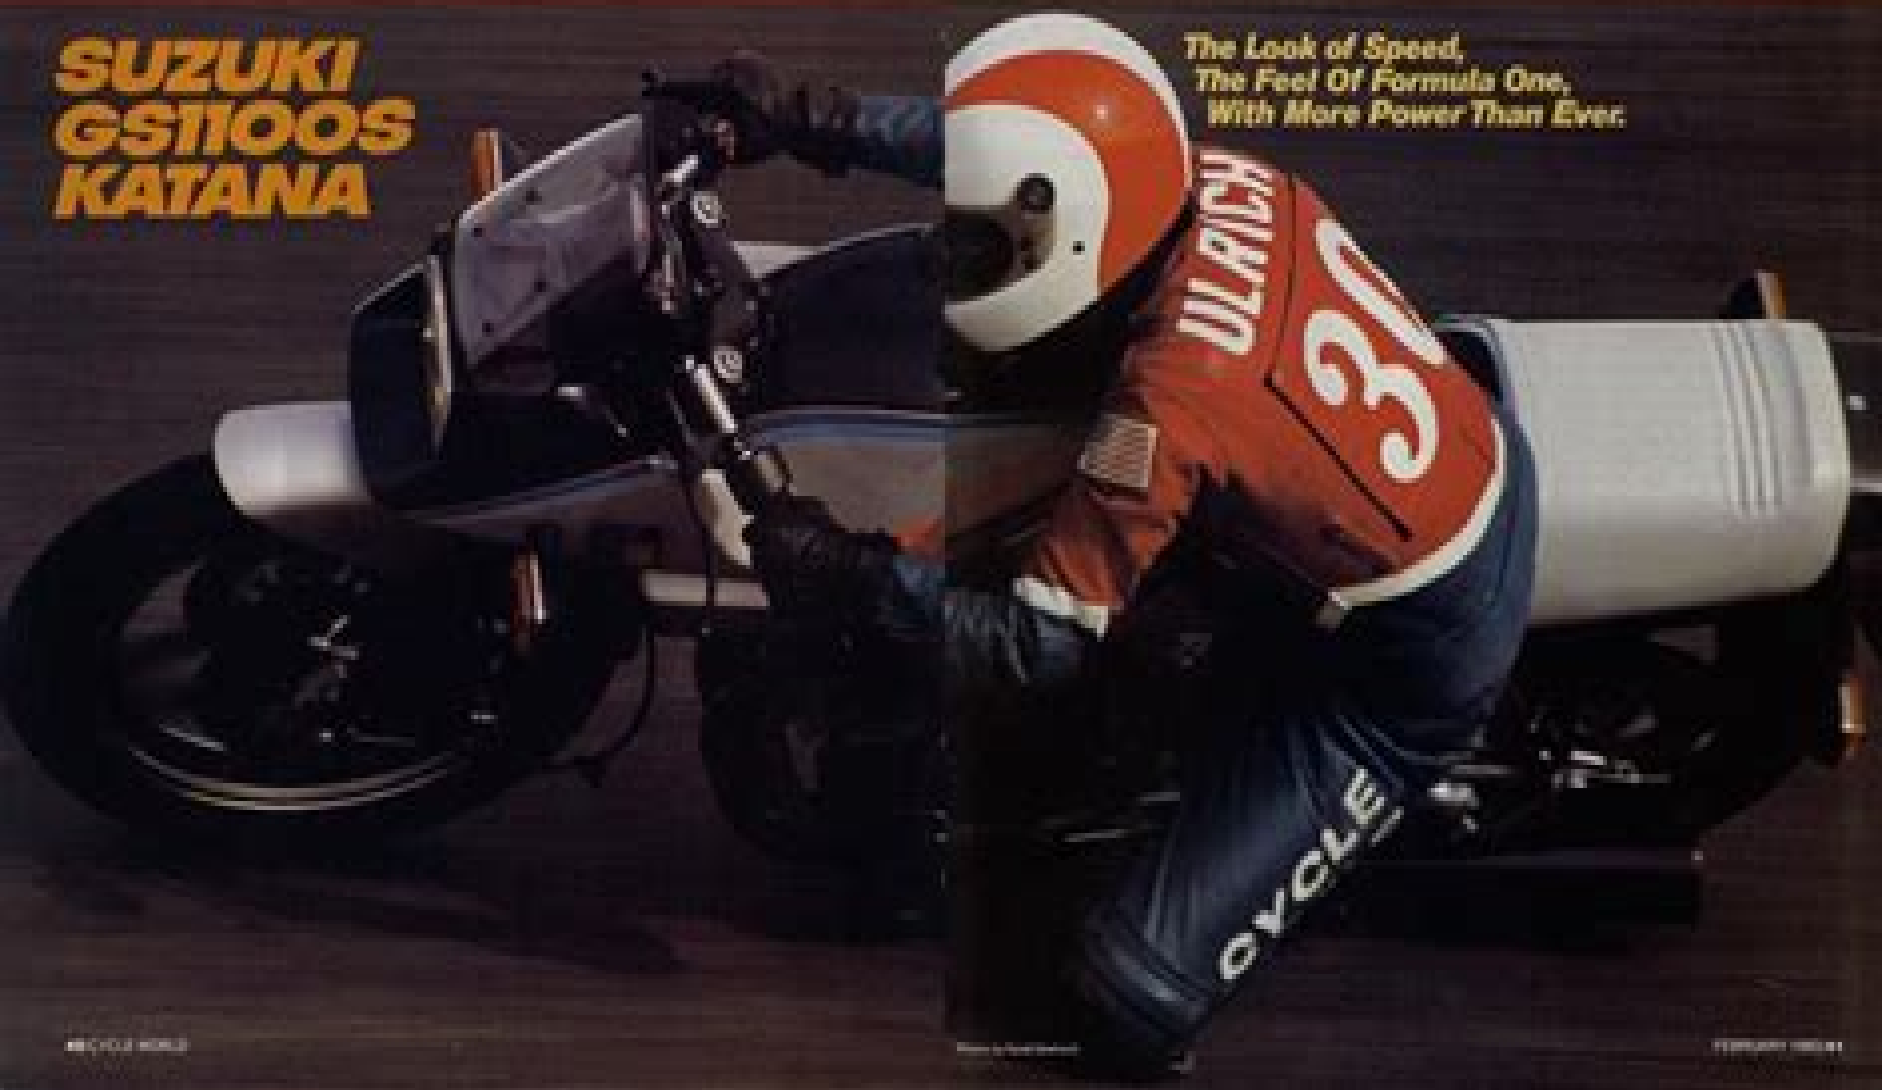

has its own intake and exhaust valves.

The shape of the combustion chamber directs incoming fuel and air forward across the combustion chamber, downward along the front of the cylinder, back across the flat-topped piston, and upward along the rear of the cylinder, clearing two vertical, near-to-front ports which promote complete mixing of gasoline and air and better distribution of that mixture throughout the cylinder.

The cylinder is then more completely and evenly charged during the intake s-
