,1978 **Metabolic Interactions Between Bacteria and Phytoplankton** Xavier Mayali,Sonya Dyhrman,Chris
Francis,2018-06-06 The cycling of energy and elements in aquatic environments is controlled by the interaction of
autotrophic and heterotrophic processes In surface waters of lakes rivers and oceans photosynthetic microalgae and
cyanobacteria fix carbon dioxide into organic matter that is then metabolized by heterotrophic bacteria and perhaps archaea
Nutrients are remineralized by heterotrophic processes and subsequently enable phototrophs to grow The organisms that
comprise these two major ecological guilds are numerous in both numbers and in their genetic diversity leading to a vast
array of physiological and chemical responses to their environment and to each other Interactions between bacteria and
phytoplankton range from obligate to facultative as well as from mutualistic to parasitic and can be mediated by cell to cell
attachment or through the release of chemicals The contributions to this Research Topic investigate direct or indirect
interactions between bacteria and phytoplankton using chemical physiological and or genetic approaches Topics include
nutrient and vitamin acquisition algal pathogenesis microbial community structure during algal blooms or in algal
aquaculture ponds cell cell interactions chemical exudation signaling molecules and nitrogen exchange These studies span
true symbiosis where the interaction is evolutionarily derived as well as those of indirect interactions such as bacterial
incorporation of phytoplankton produced organic matter and man made synthetic symbiosis synthetic mutualism Orchid
