Burton,1999 **Riemannian Manifolds** John M. Lee,2006-04-06 This book is designed as a textbook for a one quarter or one semester graduate course on Riemannian geometry for students who are familiar with topological and differentiable manifolds It focuses on developing an intimate acquaintance with the geometric meaning of curvature In so doing it introduces and demonstrates the uses of all the main technical tools needed for a careful study of Riemannian manifolds The author has selected a set of topics that can reasonably be covered in ten to fifteen weeks instead of making any attempt to provide an encyclopedic treatment of the subject The book begins with a careful treatment of the machinery of metrics connections and geodesics without which one cannot claim to be doing Riemannian geometry It then introduces the Riemann curvature tensor and quickly moves on to submanifold theory in order to give the curvature tensor a concrete quantitative interpretation From then on all efforts are bent toward proving the four most fundamental theorems relating curvature and topology the Gauss Bonnet theorem expressing the total curvature of a surface in term so fits topological type the Cartan Hadamard theorem restricting the topology of manifolds of nonpositive curvature Bonnet s theorem giving analogous restrictions on manifolds of strictly positive curvature and a special case of the Cartan Ambrose Hicks theorem characterizing manifolds of constant curvature Many other results and techniques might reasonably claim a place in an introductory Riemannian geometry course but could not be included due to time constraints Mathematics for Elementary Teachers Problem Solving Study Guide Don Miller,Gary L.
