

Introducción a Wireshark

El monitor de red **Wireshark** es un software multiplataforma de captura de paquetes muy extendido y de libre distribución. Permite, empleando una interfaz gráfica, visualizar los paquetes que circulan por el medio físico.

Esta basado en unas librerías de captura de paquetes conocidas como "pcap" (**p**acket **c**apture) para entornos Linux, o "winpcap" (**w**indows **p**acket **c**apture) para entornos Windows.

El formato de los ficheros de captura que Wireshark utiliza es compatible con otras herramientas tales como **tcpdump**, **tcptrace**, **tcpflow**, **snort**, **ntop**, etc., todas ellas especializadas en el tratamiento de capturas de paquetes.

Inicio de una captura de paquetes que circulan por la red

Antes de empezar a capturar paquetes, hay que indicar una serie de parámetros en la ventana de control de la captura de paquetes (**Capture > Options**)

- **Interface:** hay que seleccionar la interfaz de red que se empleará para capturar información. Selecciona el dispositivo Ethernet que conecta tu PC a la red Ethernet del aula.
- **Capture files:** esta opción permite indicar un fichero donde se almacenará la información capturada para un análisis posterior de los paquetes.
