Ice Age Southern Andes C.J. Heusser, 2003-11-12. The Southern Andes stretching from the subtropics to the subantarctic are ideally located for palaeoenvironmental research. Over the broad and continuous latitudinal extent of the cordillera, 24 vegetation is adjusted to climatic gradients and atmospheric circulation patterns. Opposed to the prevailing Southern Westerlies, the Southern Andes are positioned to receive the brunt of the winds while biota are set to record the shifting of incoming storm systems over time. Sequential latitudinally placed sedimentary deposits containing microfossils and macroremains as archives of past vegetation and climate make possible the detection of equatorward and poleward displacement of plant communities and as a consequence changes in climatic controls. No terrestrial setting in the Southern Hemisphere is so unique for palaeoenvironmental reconstruction during and since the last ice age. Twenty radiocarbon dated fossil pollen and spore records chosen to place emphasis on the last ice age include high resolution submillennial data sets that also cover the Holocene, thus providing contrast between present interglacial and past glacial ages. From a refined database, the records constitute the foundation for interpreting factors responsible for vegetation change over 50,000 ¹⁴C years: glacial, interglacial migration and refugial patterns for a diversity of taxa and the extent of intrahemispheric and polar hemispheric synchronicity versus asynchronicity.
