Tensor Trigonometry Ninul A.S., The Tensor Trigonometry with revealing a tensor nature of the angles and their functions and added by differential trigonometry is developed for wide applications in various fields. Planimetry includes metric part and trigonometry. In geometries of metric spaces from the end of XIX age their tensor forms are widely used. Trigonometry was remaining in its scalar flat forms. Tensor Trigonometry is its development from Leonard Euler classic forms into spatial k -dimensional at $k \geq 2$ tensor forms with vector and scalar orthoprojections with step-by-step increasing a complexity and opportunities. Described in the book are fundamentals of this new mathematical subject with many initial examples of applications. In theoretic plan Tensor Trigonometry complements naturally Analytic Geometry and Linear Algebra. In practical plan it gives the clear tools for analysis and solutions of various geometric and physical problems in homogeneous isotropic spaces as Euclidean, quasi and pseudo-Euclidean ones on perfect surfaces of constant radius embedded into them with n -D non-Euclidean Geometries and in Theory of Relativity. So it gives classic projective models of non-Euclidean Geometries as trigonometric ones, general laws of summing two steps and polysteps motions in complete differential and integral forms with polar decomposition of the sum into principal and induced orthospherical motions. The applications were developed till the differential tensor trigonometry of world lines and curves in 3D and 4D pseudo and quasi-Euclidean spaces in addition to the classic Frenet-Serret theory with absolute and relative differential geometric parameters of curves, main kinematic and dynamical characteristics of a body moving in space-time along a world line with 4-velocity of
