What do the blue whale and great white shark have in common?
 Both these creatures live in the water, have dorsal fins, and
streamlined bodies, but in reality, they're as different from one another
 as Maya and the shark.

The blue whale breathes through lungs and has a skeleton of bones
 whereas the great white shark breathes through gills and has
cartilage instead of bones.

Thus, a blue whale is a mammal like Maya and not a fish like the
 great white shark.

In this manner, scientists group organisms into different categories after
 researching their similarities and differences. This system of grouping is
 called taxonomic classification.

Trying to find a specific organism among the two million discovered
 organisms on Earth can become a laborious task for a scientist. Complicating
 things further is the fact that a single species is often known
 by different names in different countries.

Taxonomic classification also helps scientists name organisms. These names
 are very specific for each organism and help to avoid
 confusion.

Early scientists divided the living world into two groups—plants and
animals—based on one major characteristic: how they obtain
nutrition.
