A Manual of Paper Chromatography and Paper Electrophoresis Richard J. Block, Emmett L. Durrum, Gunter Zweig, 2013-10-22 A Manual of

Paper Chromatography and Paper Electrophoresis provides a comprehensive discussion of the techniques of paper chromatography and paper electrophoresis. The book is organized into two parts. Part I on paper chromatography provides a readily accessible source for some of the many uses and adaptations of paper chromatography. An effort has been made to write a practical manual in which tried and proved procedures employing relatively simple equipment and available reagents are summarized. Part II on paper electrophoresis discusses basic principles and methodology. The emphasis throughout has been on the separation of protein mixtures, particularly blood serum. This reflects the fact that it is in this particular application that paper electrophoresis has thus far not been challenged by paper chromatography, whereas many of the smaller molecules can be resolved equally well or better by the thus far more widely employed chromatographic procedures.

Basic Concepts Of Analytical Chemistry S. M. Khopkar, 1998. Analytical Chemistry has made significant progress in the last two decades. Several methods have come to the forefront while some classical methods have been relegated. An attempt has been made in this edition to strike a balance between these two extremes by retaining most significant methods and incorporating some novel techniques. Thus, an endeavour has been made to make this book up to date with recent methods. The first part of this book covers the classical volumetric as well as gravimetric methods of analysis. The separation methods are prerequisite for dependable quantitative methods of analysis. Therefore, not only solvent extraction separations but also chromatographic methods such as adsorption, partition, ion exchange, exclusion, and electrochromatography have been included to keep pace with modern developments. The newly discovered techniques such as ion chromatography, supercritical fluid chromatography, and capillary electrophoresis have been included. The next part of the book encompasses the well-known spectroscopic methods such as UV, visible, IR, NMR, and ESR techniques and also atomic absorption and plasma spectroscopy and molecular luminescence methods. Novel analytical techniques such as Auger ESCA and photoacoustic spectroscopy of surfaces are also included. The final part of this book covers thermal and radioanalytical methods of analysis. The concluding chapters on electroanalytical techniques include potentiometry, conductometry, coulometry, and voltammetry, inclusive of all kinds of polarography. The theme of on-line analysis is covered in automated methods of analysis. To sustain the interest of the reader, each chapter is provided with latest references to the monographs in the field. Further, to test the comprehension of the subject, each chapter is provided with a large number of solved and unsolved problems. This book should be useful to those readers who have requisite knowledge in chemistry and are majoring in analytical chemistry. It is also useful to practising chemists whose sole aim is to keep abreast with modern developments in the field.
