WATER CYCLE

Did you know that the water in your bottle could be the same water that dinosaurs drank millions of years ago? There is the same amount of water on Earth as there was when the Earth was formed. Water is all around us. All the water we see in rivers, seas and oceans have been here for billions of years. Without water, there will be no life on Earth!

Earth does not create new water. All the water just recycles over and over again. This process is called the **water cycle**.

Water cycle, is the continuous movement of water from the Earth's surface to the atmosphere and then back to the ground. The water cycle never ends. Water goes through all the three states, solid-liquid-gas, in the process. The sun powers the water cycle.

Water cycle has four stages. The first stage is **evaporation**. Have you ever boiled water? When you boil water, you can see steam rising up. Sun heats up the water in rivers, lakes and oceans. This water turns into water vapour(gas) and travels up into the atmosphere.

As the water vapour rises up into the atmosphere, it gets colder. The water vapour turns back into water droplets. This is called **condensation**. All the small water droplets cling together to form clouds.

When clouds get too heavy the water droplets fall back to Earth's surface. This is called as **precipitation**. The water falls as rain, snow or hail. When water hits the earth, it runs off into rivers and seas. Some goes under the ground. And some water is frozen as mountain ice caps. This final stage is called as **collection**. Eventually this water will evaporate back up into the atmosphere.

In this way, the water on Earth moves again and again in a cycle. This is how the water cycle has been going on for billions of years, bringing fresh water to people, animals and plants, helping them survive all around the earth.
