

5th grade FCAT 2.0 Science Study Guide

THE NATURE OF SCIENCE!

- 1.) 3 types of scientific investigations: a controlled experiment, repeated observations, or making a model
- 2.) A control group is used to compare the test group (the group with "treatment") to a control group with no "treatment" to see if the "treatment" in fact made a change. A control group is very important to the design of an experiment to be sure that what you are testing is actually working as suspected. For example, if you wanted to know which laundry detergent works best. You would have two types of detergent. You would control the type of fabric, the stain, the amount of time the stain sat in, the temperature of the water, the amount of time the stain is scrubbed, etc.. You would also have a control group. This group would get NO detergent so you could see if detergent actually worked better than water alone with no detergent.
- 3.) It's very important for scientists to write down EVERY step of an investigation so they can repeat it for repeated trials so their results are reliable, AND so other scientists can REPLICATE their experiment. [Replicate means to repeat an experiment AND get similar or the same results.] Scientists repeat and replicate experiments of others to test validity and reliability. The more often an experiment can be replicated, the more accepted the findings.
- 4.) When you gather information about the real world through the use of your senses you are gathering observations!
