1. Set Δt to a small value (e.g., 0.01) and choose an initial value for x .
2. Repeat the following steps until x is close to 0:
 - a. Calculate $f(x)$ using the function $f(x) = x^2 - 1$.
 - b. Update x using the formula $x = x - \Delta t \cdot f(x)$.
3. Print the value of x and the number of iterations.

Summary: The case presents a case of a 16-year-old adolescent with a history of chronic pain. The patient is a female, born in 1998, who has been experiencing chronic pain since the age of 10. The pain is described as a constant, dull ache in the lower back and legs, which is exacerbated by physical activity and stress. The patient has been treated with various medications, including painkillers and antidepressants, but with limited success. The case also mentions the patient's family history, which includes a mother with a history of chronic pain and a father with a history of depression. The patient is currently attending a private school and is struggling with her academic performance due to the pain. The case is presented as a challenge for the reader to identify the underlying condition and propose a management plan.

What starts?	What changes?
Pressure on (or inside)	The net movement of the fluid decreases (if the fluid is more strongly attracted to the net)
Increasing depth	None. If the pressure (and hence attraction) is going constant, it doesn't matter how deep you are.
Increasingly moving water	If the fluid is moving horizontally, the pressure will be higher in the direction of flow.
Equal size and constant shape changed	The pressure will be the same, and if the composition is changed, the pressure will be higher for the one that changes least to a new given state.
If the container is moved slowly	If the fluid is not attracted to the sides, and after a little time, the net will not move to the left. If the fluid is attracted, it will move to the pressure (left) side.
