Quantum Gravity Claus Kiefer, 2025-04-03 The description of Nature in physics currently falls into two parts: the microscopic and the macroscopic. The microscopic world—molecules, atoms, particles—is described by quantum theory, whereas the macroscopic world—planets, stars, galaxies, universe—is ruled by a classical interaction, gravity, that is described by Einstein's theory of general relativity. This book describes in detail the attempts to unify quantum theory and relativity, which are essential to understanding the origin of the Universe and the final fate of black holes. The construction of a consistent quantum theory is among the most important open problems in fundamental physics. This book describes the motivation for constructing such a theory and presents the main approaches. These approaches include covariant quantization, canonical quantization, metric and loop approaches, and string theory. The book also covers the main applications, which include black holes and cosmology. This new edition includes updated content throughout, as well as further explorations of the holographic principle, unimodular gravity, quantum gravitational correction terms, and possible observations, as these are topics that have experienced important developments since the last edition.
