Suggestion Of H S C 2015:

Liver Myofibroblasts Jiri Kanta, Alena Mrkvicová, Ralf Weiskirchen, 2016-10-25 Myofibroblasts MFB are found in most tissues of the body. They have the matrix producing functions of fibroblasts and contractile properties that are known from smooth muscle cells. Fundamental work of the last decades has shed remarkable light on their origin, biological functions, and role in disease. During hepatic injury, they fulfill manifold functions in connective tissue remodeling and wound healing, but overshooting activity of MFB on the other side induces fibrosis and cirrhosis. The present e-book *Liver myofibroblasts* contains 9 articles providing comprehensive information on hot topics of MFB. In our opening editorial, we provide a short overview of the origin of MFB and their relevance in extracellular matrix formation, which is the hallmark of hepatic fibrosis. Thereafter, leading experts in the field share their current perspectives on special topics of i) MFB in development and disease, ii) their role in hepatic fibrogenesis, and iii) promising therapies and targets that are suitable to interfere with hepatic fibrosis.

10 Years of Inflammation Pharmacology Paola Patrignani, Dieter Steinhilber, 2020-07-07 The past and future of inflammatory pharmacology research: a hot topic in health and disease. Inflammation is a physiological response to a traumatic injury, bacterial or viral infection. However, if not appropriately controlled, it contributes to a long list of diseases, including asthma, atherosclerosis, multiple sclerosis, arthritis, and cancer. Different are the types of inflammatory responses. Acute inflammation is an immediate body response to the cellular damage induced by pathogens, noxious stimuli, or physical injury; it is a short-term response resulting in healing via time-dependent changes of leukocyte functions. First, a leukocyte infiltration happens within the damaged region with the purpose of eliminating the stimulus and repairing the tissue. Chronic inflammation, by contrast, is a prolonged and dysregulated response where the active inflammation contributes both to tissue destruction and to the development of many chronic human conditions and diseases. In the context of exaggerated inflammation, which occurs as a consequence of severe burns or trauma, the body response called sepsis can be associated with a fatal outcome. Increased knowledge of the cellular and molecular mechanisms taking part in the different types of inflammation is a central requirement to develop more effective and safer treatments. This is a necessary step to prevent potential severe consequences, i.e., organ failure associated with tissue fibrosis. The mission of Inflammation Pharmacology section of *Frontiers in Pharmacology* is to publish scientifically sound studies that advance our knowledge on different aspects of inflammation and contribute to the development of more effective and safer anti-inflammatory agents. Within the present eBook, we collected the top articles published in the Inflammation Pharmacology section in the last 10 years. Some articles explored the roles played by different lipid mediators generated from arachidonic acid, including leukotrienes and prostanoids such as prostacyclin and prostaglandin PG F_{2a} in inflammatory conditions. Moreover, the protectin PD family of specialized pro-resolving mediators biosynthesized from the two omega-3 polyunsaturated fatty acids, docosahexaenoic acid (DHA) and n-3 docosapentaenoic acid (n-3 DPA), were described for their biological effects. The G-coupled protein receptors

pharmacology biosynthesis and medicinal chemistry Some other articles focused on the development of novel strategies to counteract inflammation or to induce its resolution The current concepts and controversies on classification pathogenesis and clinical management of cutaneous adverse events induced by biologic agents used in the treatment of rheumatologic conditions were discussed in another article The whole exome and whole genome sequencing data identifying new and old loci associated with atherosclerosis will lead to discovering new molecular targets for blocking atherosclerosis even in its early stages This critical issue was reviewed in another paper Numerous information on an individual clinical condition is held in their platelet derived microparticles MPs the assessment of their number and size together with their content can represent the signature to acquire diagnostic information and to monitor the efficacy of therapeutic agents Some other articles discussed the role of fibroblasts in the development of fibrosis and potential therapies under investigation It was enlightened the role of the activation and transdifferentiation of hepatic stellate cells HSCs into contractile matrix producing myofibroblasts MFBs as central events in hepatic fibrogenesis and summarized the current strategies for targeted delivery of drugs to pro fibrogenic liver cells including the development of therapeutics specifically targeting HSCs Continued in eBook

Endothelial Dynamics in Health and Disease Jaap Diederik Van Buul, Stephan Huveneers, Mariona Graupera, Elizabeth Anne Vincent Jones, 2021-01-06 **RUNX Proteins in Development and Cancer** Yoram Groner, Yoshiaki Ito, Paul Liu, James C. Neil, Nancy A. Speck, Andre van Wijnen, 2017-03-15 This volume provides the reader with an overview of the diverse functions of the RUNX family of genes As highlighted in the introduction and several of the 29 chapters humans and other mammals have three RUNX genes that are known to play specific roles in blood bone and neuronal development However their evolutionary history has recently been traced back to unicellular organisms and their involvement in many well known signaling pathways Wnt TGFb Notch Hippo is indicative of a more general function in cell biology Their documented roles in cell fate decisions include control of proliferation differentiation survival senescence and autophagy The pleiotropic effects of RUNX in development are mirrored in cancer where RUNX genes can function as oncogenes that collaborate strongly with Myc family oncogenes or as tumour suppressor genes In the latter role they display

hallmarks of both gatekeepers that modulate p53 responses and caretakers that protect the genome from DNA damage. Several chapters focus on the importance of these genes in leukemia research where RUNX1 and CBFB are frequently affected by chromosomal translocations that generate fusion oncoproteins while recent studies suggest wider roles for RUNX modulation in solid cancers. Moreover, RUNX genes are intimately involved in the development and regulation of the immune system while emerging evidence suggests a role in innate immunity to infectious agents including HIV. At the biochemical level, the RUNX family can serve as activators or repressors of transcription and as stable mediators of epigenetic memory through mitosis. Not surprisingly, RUNX activity is controlled at multiple levels; this includes miRNAs and a plethora of post-translational modifications. Several chapters highlight the interplay between the three mammalian RUNX genes where cross-talk and partial functional redundancies are evident. Finally, structural analysis of the RUNX-CBFB interaction has led to the development of small molecule inhibitors that provide exciting new tools to decipher the roles of RUNX in development and as targets for therapy. This volume provides a compendium and reference source that will be of broad interest to cancer researchers, developmental biologists, and immunologists.
