B.5.A describe the stages of the cell cycle, including deoxyribonucleic acid (DNA) replication and mitosis, and the importance of the cell cycle to the growth of organisms; Readiness Standard

DNA Replication

A process that transforms one DNA molecule into 2 identical copies; enzyme help DNA strands unwind and separates; each DNA strand serves as a template (pattern) for a new, complementary strand to form by matching (pairing) nitrogen bases. As a result, each new DNA molecule contains half of the original molecule.

Replication Facts

- DNA has to be copied before a cell divides
- DNA is copied during the S phase of the cell cycle
- New cells will need identical DNA strands

Meiosis and Mitosis Jean Brachet, 1961 *Meiosis and Mitosis* Jean Brachet, Alfred E. Mirsky, 2014-05-10 The Cell Biochemistry Physiology Morphology Volume III Meiosis and Mitosis covers chapters on meiosis and mitosis The book discusses meiosis with regard to the meiotic behavior of chromosomes the anomalous meiotic behavior in organisms with localized centromeres and in forms with nonlocalized centromeres and the nature of the synaptic force The text also describes the mechanism of crossing over the relationship of chiasmata to crossing over and metaphase pairing and the reductional versus equational disjunction The process of mitosis and the physiology of cell division are also considered The

book further tackles the significance of cell division and chromosomes the essential mitotic plan and its variants the preparations for mitosis and the transition period The text also demonstrates the time course of mitosis the mobilization of the mitotic apparatus metakinesis the metaphase the mitotic apparatus anaphase telophase cytokinesis and the physiology of the dividing cell Physiological reproduction mitotic rhythms and experimental synchronization and the blockage and stimulation of division are also encompassed Biologists microbiologists zoologists and botanists will find the book invaluable
