Author and Audience in Vitruvius' De architectura Marden Fitzpatrick Nichols,2017-10-26 Vitruvius De architectura is the only extant classical text on architecture and its impact on Renaissance masters including Leonardo da Vinci is well known But what was the text s purpose in its own time ca 20s BCE In this book Marden Fitzpatrick Nichols reveals how Vitruvius pitched the Greek discipline of architecture to his Roman readers most of whom were undoubtedly laymen The inaccuracy of Vitruvius architectural rules when compared with surviving ancient buildings has knocked Vitruvius off his pedestal Nichols argues that the author never intended to provide an accurate view of contemporary buildings Instead Vitruvius crafted his authorial persona and remarks on architecture to appeal to elites and would be elites eager to secure their positions within an expanding empire In this major new analysis of De architectura from archaeological and literary perspectives Vitruvius emerges as a knowing critic of a social landscape in which the house made the man *The Author, Playwright and Composer* ,1913 *Clouds and Sunshine. Monack,Katharina F. Kubatzky,2016-10-07 Bacterial pathogenicity factors are functionally diverse They may facilitate the adhesion and

colonization of bacteria influence the host immune response assist spreading of the bacterium by e.g. evading recognition by immune cells or allow bacteria to dwell within protected niches inside the eukaryotic cell. Exotoxins can be single polypeptides or heteromeric protein complexes that act on different parts of the cells. At the cell surface they may insert into the membrane to cause damage, bind to receptors to initiate their uptake or facilitate the interaction with other cell types. For example, bacterial superantigens specifically bind to major histocompatibility complex MHC II molecules on the surface of antigen presenting cells and the T cell receptor while cytolysins cause pore formation. For intracellular activity, exotoxins need to be translocated across the eukaryotic membrane. Gram negative bacteria can directly inject effector proteins in a receptor independent manner by use of specialized needle apparatus such as bacterial type II, III or type IV secretion systems. Other methods of translocation include the phagocytic uptake of bacteria followed by toxin secretion or receptor mediated endocytosis which allows the targeting of distinct cell types. Receptor based uptake is initiated by the binding of heteromeric toxin complexes to the cell surface and completed by the translocation of the effector proteins across the endosomal membrane. In the cytosol, toxins interact with specific eukaryotic target proteins to cause post translational modifications that often result in the manipulation of cellular signalling cascades and inflammatory responses. It has become evident that the actions of some bacterial toxins may exceed their originally assumed cytotoxic function. For example, pore forming toxins do not only cause cytolysis but may also induce autophagy, pyroptosis or activation of the MAPK pathways resulting in adjustment of the host immune response to infection and modification of inflammatory responses both locally and systemically. Other recently elucidated examples of the immunomodulatory function of cell death inducing exotoxins include TcdB of *Clostridium difficile* which activates the inflammasome through modification of cellular Rho GTPases or the *Staphylococcus* δ toxin which activates mast cells. The goal of this research topic was to gather current knowledge on the interaction of bacterial exotoxins and effector proteins with the host immune system. The following 16 research and review articles in this special issue describe mechanisms of immune modification and evasion and provide an overview over the complexity of bacterial toxin interaction with different cells of the immune system.
