Content Strands	Number & Algebra						
Sub Strands	Number & Place Value			Fractions and Decimals	Money and Financial Mathematics	Patterns & Algebra	
Big Idea 1 Concept Key Understanding	Counting the Count		Place Value	Addition & Multiplication Thinking	Partitioning		
	Numbers are said in a particular order and there are patterns in the way we say them The teacher/parent would tell us how many in five each A collection of nine many number what it looks like (ie. 1 apple, 4 pencils, 10 marbles) We can recognise small collections without counting (jumping) Collections can be measured, compared and classified (ie. as many as, less than, equal to... or between 5 and 10 number, different)	In place value we write numbers (ie. 10 ones is 1 ten, 10 tens is 1 hundred, ...) In place value there are names for thousands units (multiples of 10) (ie. tens, hundreds, thousands)	Numbers can be named in terms of their parts (part part whole, 7 is 6 and 1, 3 and 1, 4 and 3, ...) Numbers have properties that help us work fluently with them (eg. 7 is 5 and 2, 5 and 2 is 7, 10 and 1 is 9) Rounding and partitioning numbers is useful for mental and written calculation	The number of parts named (ie. part (ie. 2 parts - halves, 1 part - whole) The number of parts named (ie. part (ie. 2 parts - halves, 1 part - whole) Two fractions have equal parts Language is important (ie. 7 then 1 out of 2 apples, then half - how many out of how many)	Currency has different values and can be recognised and sorted according to appearance and value The size of Australian coins and notes do not determine their value Each country has its own currency Currency provides access to food and services	A pattern requires an element of repetition that can be described and generalised with symbols Patterns can be represented in many ways including using combinations of numbers, objects and symbols Patterns are all around us	
Australian Curriculum Content Descriptor	Develop confidence with number sequences to and from 100 by one from any starting point. Skip count by 2s, 5s and 10s using objects and	Recognise, model, read, write and order numbers to at least 100. Locate these numbers on a number line	Count collections to 100 by partitioning numbers using place value	Represent and solve simple addition and subtraction problems using a range of strategies including counting on, partitioning and grouping parts	Recognise and describe one half as one of two equal parts of a whole	Recognise, describe and order Australian coins according to their value	Investigate and describe number patterns formed by skip counting and counting with objects
Learning Intention Standard	Students describe number sequences counting from skip counting by 2s, 5s and 10s	Students read and write from 100 and locate numbers on a number line	Students partition numbers using place value	Students carry out simple additions and subtractions using counting strategies	Students identify representations of one half	Students recognise Australian coins according to their value	Students describe simple patterns involving numbers and objects

Quantum Groups Ross Street, 2007-01-18 Algebra has moved well beyond the topics discussed in standard undergraduate texts on modern algebra Those books typically dealt with algebraic structures such as groups rings and fields still very important concepts However *Quantum Groups A Path to Current Algebra* is written for the reader at ease with at least one such structure and keen to learn algebraic concepts and techniques A key to understanding these new developments is categorical duality A quantum group is a vector space with structure Part of the structure is standard a multiplication making it an algebra Another part is not in those standard books at all a comultiplication which is dual to multiplication in the precise sense of category theory making it a coalgebra While coalgebras bialgebras and Hopf algebras have been around for half a century the term quantum group along with revolutionary new examples was launched by Drinfeld in 1986 *Research in Mathematics Education in Australasia 2008-2011* Bob Perry, Tom Lowrie, Tracy Logan, Amy MacDonald, Jane Greenlees, 2012-09-11 This is the eighth edition of the four yearly review of mathematics education research in Australasia Commissioned by the Mathematics Education Research Group of Australasia MERGA this review critiques the most current Australasian research in mathematics education in the four years from 2008 2011 The main objective of this review is to celebrate and recognise significant findings highlight relationships between research identify themes and forecast further research directions This theme based review has produced a comprehensive analysis of Australasian research in a politically challenging time producing a manuscript with implications for a wider international audience As the 2009 Felix Klein medal winner Gilah Leder states A substantial body of research is captured in the chapters of this review It

encompasses the labours of a community of active researchers with varied interests and diverse theoretical perspectives Some of the issues explored in the period covered by this volume clearly resonate with questions and concerns particularly pertinent to the changing educational environment others are more aptly described as continuing or renewed explorations of areas of long standing concern

Abelian Groups, Module Theory, and Topology Dikran Dikranjan, 2019-05-16 Features a stimulating selection of papers on abelian groups commutative and noncommutative rings and their modules and topological groups Investigates currently popular topics such as Butler groups and almost completely decomposable groups

Lectures on Real Analysis Finnur Lárusson, 2012-06-07 This is a rigorous introduction to real analysis for undergraduate students starting from the axioms for a complete ordered field and a little set theory The book avoids any preconceptions about the real numbers and takes them to be nothing but the elements of a complete ordered field All of the standard topics are included as well as a proper treatment of the trigonometric functions which many authors take for granted The final chapters of the book provide a gentle example based introduction to metric spaces with an application to differential equations on the real line The author's exposition is concise and to the point helping students focus on the essentials Over 200 exercises of varying difficulty are included many of them adding to the theory in the text The book is perfect for second year undergraduates and for more advanced students who need a foundation in real analysis

Wavelets Peter Nickolas, 2017-01-11 This text offers an excellent introduction to the mathematical theory of wavelets for senior undergraduate students Despite the fact that this theory is intrinsically advanced the author's elementary approach makes it accessible at the undergraduate level Beginning with thorough accounts of inner product spaces and Hilbert spaces the book then shifts its focus to wavelets specifically starting with the Haar wavelet broadening to wavelets in general and culminating in the construction of the Daubechies wavelets All of this is done using only elementary methods bypassing the use of the Fourier integral transform Arguments using the Fourier transform are introduced in the final chapter and this less elementary approach is used to outline a second and quite different construction of the Daubechies wavelets The main text of the book is supplemented by more than 200 exercises ranging in difficulty and complexity
