**High Performance Liquid Chromatography** Heinz Engelhardt, 2012-12-06 Modern liquid column chromatography LC has developed rapidly since 1969 to become a standard method of separation If the statisticians are to be believed the recent growth of LC has been the most spectacular development in analytical chemistry and has not yet abated because its vast potential for application remains to be fully exploited Significant factors contributing to this continued rise are the simplicity and low cost of the required basic equipment and the relative ease of acquiring and interpreting the data Unfortunately in LC as so often in the field of analytical chemistry the available commercial instruments are frequently far more complicated and consequently far more expensive than is necessary for routine application Therein also lies the risk of propagating a black box philosophy that would be particularly detrimental to chromatography Moreover it appears to have been forgotten as was done previously with gas chromatography that inadequate separation by a column can be remedied only with great difficulty if at all by electronic means Also whether the capillary columns recently advocated with great enthusiasm for LC will fulfill the expectations of their proponents is highly questionable unless someone comes up with some new and revolutionary ideas

**Advanced Sensor and Detection Materials** Ashutosh Tiwari, Mustafa M. Demir, 2014-06-09 Presents a comprehensive and interdisciplinary review of the major cutting edge technology research areas especially those on new materials and methods as well as advanced structures and properties for various sensor and detection devices The development of sensors and detectors at macroscopic or nanometric scale is the driving force stimulating research in sensing materials and technology for accurate detection in solid liquid or gas phases contact or non contact configurations or multiple sensing The emphasis on reduced scale detection techniques requires the use of new materials and methods These techniques offer appealing perspectives given by spin crossover organic inorganic and composite materials that could be unique for sensor fabrication The influence of the length composition and conformation structure of materials on their properties and the possibility of adjusting sensing properties by doping or adding the side groups are indicative of the starting point of multifarious sensing The role of intermolecular interactions polymer and ordered phase formation as well as behavior under pressure and magnetic and electric fields are also important facts for processing ultra sensing materials The 15 chapters written by senior researchers in Advanced Sensor and Detection Materials cover all these subjects and key features under three foci 1 principals and perspectives 2 new materials and methods and 3 advanced structures and properties for various sensor devices
