Ultracentrifugation of Macromolecules J. W. Williams, 2013-10-22 Ultracentrifugation of Macromolecules Modern Topics covers the theoretical description of the problem of sedimentation equilibrium of polydisperse nonideal solutions The book discusses the sedimentation equilibrium in polydisperse nonideal solutions and the size distribution analysis by ultracentrifugal methods The text also describes the simultaneous sedimentation and equilibrium in beta lactoglobulin B chymotrypsinogen A and lysozyme solutions as well as the sedimentation analysis of a multiple myeloma G globulin People involved in physical biochemistry will find the book invaluable Modern Methods of Polymer Characterization Howard G. Barth, Jimmy W. Mays, 1991-09-03 Presents the methods used for characterization of polymers In addition to theory and basic principles the instrumentation and apparatus necessary for methods used to study the kinetic and thermodynamic interactions of a polymer with its environment are covered in detail Some of the methods examined include polymer separations and characterization by size exclusion and high performance chromatography inverse gas chromatography osmometry viscometry ultracentrifugation light scattering and spectroscopy Textbook of Polymer Science Fred W. Billmeyer, 1984-03-21 This Third Edition of the classic best selling polymer science textbook surveys theory and practice of all major phases of polymer science engineering and technology including polymerization solution theory fractionation and molecular weight measurement solid state properties structure property relationships and the preparation fabrication and properties of commercially important plastics fibers and elastomers **National Library of Medicine Current Catalog** National Library of Medicine (U.S.),1973 First multi year cumulation covers six years 1965 70 Biophysical Approaches Edward D. Korn, 2013-04-17 The short period since the publication of Volume 1 of Methods in Membrane Biology has been a time of momentous progress Calorimetry electron spin and nuclear magnetic resonance X ray diffraction and freeze cleavage electron microscopy reinforced by biochemical analyses and enzymatic studies have led to universal acceptance of a generalized membrane model All membrane biologists would agree that a major element of all biological membranes is a bilayer of phospholipids which in some instances also contains other lipids notably sterols and glycolipids The fatty acid com position of the lipids of most membranes is such that the lipids are above their transition temperatures in their normal environment so that the bilayer is fluid The microviscosity of the fatty acyl groups decreases pro gressively down the chain so that at the hydrocarbon interior of the bilayer the lipid phase has a viscosity approximating that of olive oil at room temperature As a consequence of this membrane fluidity a phospholipid molecule is very mobile within the plane of the membrane moving a distance of about 1 2 fLm in 1 s but the movement of a phospholipid molecule from one side of the membrane bilayer to the other flip flop is very slow The lipid bilayer is an essentially inert and rather impermeable struc ture as shown by many studies with model systems Proteins of course provide the catalytic components of the membranes as well **Analytical Ultracentrifugation in Biochemistry and Polymer Science** as playing a significant structural role
