
Solutions to Chapter 9 Problem Assignments

Check Your Understanding

1. *Corporate Income*

Explain how a corporation's income is subject to double taxation.

Solution: Corporate income is taxed as regular income as it is earned by the corporation; it is taxed a second time when the corporation distributes that income as dividends to its shareholders.

2. *Corporate Characteristics*

List five desirable characteristics of the corporate form of business.

Solution: 1. Limited liability for owners; 2. Ease of raising capital; 3. Ease of selling ownership interest (shares); 4. Ability of owner-shareholder to receive a salary deductible as an expense by the corporation; 5. Ability of owner-shareholder to participate in corporate fringe benefits. (There are benefits beyond these five.)

3. *Dividend Received Deduction*

What is a dividend received deduction? What are the percentages and when do they apply? When is the dividend received deduction limited to a percentage of net income?

Solution: The dividend received deduction is a percentage of a dividend received by another corporation that is allowed as a deduction from that corporation's income and, as a result, is not subject to tax.

A corporation that owns less than 20 percent of another corporation is entitled to a 70 percent dividend received deduction. A corporation that owns at least 20 percent but less than 80 percent is entitled to an 80 percent dividend received deduction. An affiliated corporation (80 percent or more ownership) is entitled to a 100 percent dividend received deduction.

A dividend received deduction is limited to a percentage of net income unless taking the full dividend received deduction creates or increases a net operating loss for the corporation.

4. *Charitable Contribution*

What is a corporation's overall charitable contribution deduction limitation?

Solution: The contribution deduction is limited to 10 percent of net income before the dividend received deduction and any net operating or capital loss carrybacks.

5. *NOL Carryovers*

What are the carryover periods for corporate net operating losses?

Solution: Net operating losses may be carried back 2 years and forward 20 years.

EBOOK: Vector Mechanics for Engineers: Dynamics (SI) Ferdinand Beer, E. Johnston, Phillip Cornwell, 2013-04-16 Continuing in the spirit of its successful previous editions the tenth edition of Beer Johnston Mazurek and Cornwell s Vector Mechanics for Engineers provides conceptually accurate and thorough coverage together with a significant refreshment of the exercise sets and online delivery of homework problems to your students Nearly forty percent of the problems in the text are changed from the previous edition The Beer Johnston textbooks introduced significant pedagogical innovations into engineering mechanics teaching The consistent accurate problem solving methodology gives your students the best opportunity to learn statics and dynamics At the same time the careful presentation of content unmatched levels of accuracy and attention to detail have made these texts the standard for excellence The Quadratic Assignment Problem E.

Cela, 2013-03-14 The quadratic assignment problem QAP was introduced in 1957 by Koopmans and Beckmann to model a plant location problem Since then the QAP has been object of numerous investigations by mathematicians computers scientists operations researchers and practitioners Nowadays the QAP is widely considered as a classical combinatorial optimization problem which is still attractive from many points of view In our opinion there are at least three main reasons which make the QAP a popular problem in combinatorial optimization First the number of real life problems which are mathematically modeled by QAPs has been continuously increasing and the variety of the fields they belong to is astonishing To recall just a restricted number among the applications of the QAP let us mention placement problems scheduling manufacturing VLSI design statistical data analysis and parallel and distributed computing Secondly a number of other well known combinatorial optimization problems can be formulated as QAPs Typical examples are the traveling salesman problem and a large number of optimization problems in graphs such as the maximum clique problem the graph partitioning problem

and the minimum feedback arc set problem Finally from a computational point of view the QAP is a very difficult problem The QAP is not only NP hard and hard to approximate but it is also practically intractable it is generally considered as impossible to solve to optimality QAP instances of size larger than 20 within reasonable time limits
