

The vector A (see Fig. 1-1) can be reconstructed from the components $a_x = 18.4$ and $a_y = 13.8$.

$$A = \sqrt{18.4^2 + 13.8^2} = 23 \quad \text{and} \quad \theta = \tan^{-1} \frac{13.8}{18.4} = 37^\circ$$

1-1 Diagram the vector $C = 47\angle 193^\circ$ and write the components.

Solution: The components are $c_x = 47 \cos 193^\circ = -45.8$ and $c_y = 47 \sin 193^\circ = -10.6$.

Fig. 1-3

Taking the sine or cosine of the 193° angle will produce the appropriate negative numbers, but drawing a figure and using the principle angle is a better procedure. Less mistakes are made from figures than from the readout of calculators. When the vector and its components are drawn on the coordinate system there can be no mistake that 45.8 and 10.6 are both negative.

Unit Vectors in Two Dimensions

The use of unit vectors simplifies the mathematical operations on vectors. In two dimensions **unit vectors** are vectors of unit value directed in the $+x$ and $+y$ directions.

Fig. 1-4

The vector A (Fig. 1-1) would be written as $A = 18.4i + 13.8j$ and C (problem 1-1) would be written as $C = -45.8i - 10.6j$

1-2 Add the vectors A and C .

Solution: The addition of A and C is now accomplished by adding the components

$$S = A + C = -27.4i + 3.2j$$

1-3 Subtract C from A .

Solution: $T = A - C = 64.2i + 24.4j$

Electromagnetism Félix Salazar Bloise,Rafael Medina Ferro,Ana Bayón Rojo,Francisco Gascón Latasa,2016-10-19 This book presents the fundamental concepts of electromagnetism through problems with a brief theoretical introduction at the beginning of each chapter The present book has a strong didactic character It explains all the mathematical steps and the theoretical concepts connected with the development of the problem It guides the reader to understand the employed procedures to learn to solve the exercises independently The exercises are structured in a similar way The chapters begin with easy problems increasing progressively in the level of difficulty This book is written for students of physics and engineering in the framework of the new European Plans of Study for Bachelor and Master and also for tutors and lecturers

Solved Problems in Classical Electromagnetism J. Pierrus,2018-08-02 Classical electromagnetism one of the fundamental pillars of physics is an important topic for all types of physicists from the theoretical to the applied The subject is widely recognized to be one of the most challenging areas of the physics curriculum both for students to learn and for lecturers to

teach Although textbooks on electromagnetism are plentiful hardly any are written in the question and answer style format adopted in this book It contains nearly 300 worked questions and solutions in classical electromagnetism and is based on material usually encountered during the course of a standard university physics degree Topics covered include some of the background mathematical techniques electrostatics magnetostatics elementary circuit theory electrodynamics electromagnetic waves and electromagnetic radiation For the most part the book deals with the microscopic theory although we also introduce the important subject of macroscopic electromagnetism as well Nearly all questions end with a series of comments whose purpose is to stimulate inductive reasoning and reach various important conclusions arising from the problem Occasionally points of historical interest are also mentioned Both analytical and numerical techniques are used in obtaining and analyzing solutions All computer calculations are performed with Mathematica^{CO} and the relevant code is provided in a notebook either in the solution or the comments

Exploring Classical Mechanics G. L. Kotkin, V. G. Serbo, 2020-08-10 This new edition of a popular textbook offers an original collection of problems in analytical mechanics Analytical mechanics is the first chapter in the study and understanding of theoretical physics Its methods and ideas are crucially important as they form the basis of all other branches of theoretical physics including quantum mechanics statistical physics and field theory Such concepts as the Lagrangian and Hamiltonian formalisms normal oscillations adiabatic invariants Liouville theorem and canonical transformations lay the foundation without which any further in depth study of theoretical physics is impossible Wherever possible the authors draw analogies and comparisons with similar processes in electrodynamics quantum mechanics or statistical mechanics while presenting the solutions to the problems The book is based on the authors many years of experience delivering lectures and seminars at the Department of Physics at Novosibirsk State University totalling an impressive 110 years of combined teaching experience Most of the problems are original and will be useful not only for those studying mechanics but also for those who teach it The content of the book corresponds to and roughly follows the mechanics course in the well known textbooks by Landau and Lifshitz Goldstein or ter Haar The Collection starts with the Newtonian equations motion in a central field and scattering Then the text proceeds to the established traditional sections of analytical mechanics as part of the course on theoretical physics the Lagrangian equations the Noether theorem linear and nonlinear oscillations Hamilton formalism and motion of a solid body As a rule the solution of a problem is not complete by just obtaining the required formulae It s necessary to analyse the result This can be an interesting process of discovery for the student and is by no means a mechanical part of the solution It is also very useful to investigate what happens if the conditions of the problem are varied With this in mind the authors offer suggestions of further problems at the end of several solutions First published in 1969 in Russian this text has become widely used in classrooms around the world It has been translated into several languages and has seen multiple editions in various languages

Solved Problems in Classical Mechanics O. L. de Lange,J. Pierrus,2010-05-06 Apart from an introductory chapter giving a brief summary of Newtonian and Lagrangian mechanics this book consists entirely of questions and solutions on topics in classical mechanics that will be encountered in undergraduate and graduate courses These include one two and three dimensional motion linear and nonlinear oscillations energy potentials momentum and angular momentum spherically symmetric potentials multi particle systems rigid bodies translation and rotation of the reference frame the relativity principle and some of its consequences The solutions are followed by a set of comments intended to stimulate inductive reasoning and provide additional information of interest Both analytical and numerical computer techniques are used to obtain and analyze solutions The computer calculations use Mathematica version 7 and the relevant code is given in the text It includes use of the interactive Manipulate function which enables one to observe simulated motion on a computer screen and to study the effects of changing parameters The book will be useful to students and lecturers in undergraduate and graduate courses on classical mechanics and students and lecturers in courses in computational physics 3000 Solved
