Insect Olfaction Bill S. Hansson, 2013-06-29. JOHN G. HILDEBRAND. Research on insect olfaction is important for at least two reasons. First, the olfactory systems of insects and their arthropod kin are experimentally favourable models for studies aimed at learning about general principles of olfaction that apply to vertebrates and invertebrates alike. Detailed comparisons between the olfactory pathways in vertebrates and insects have revealed striking similarities of functional organisation, physiology, and development, suggesting that olfactory information is processed through neural mechanisms more similar than different in these evolutionarily remote creatures. Second, insect olfaction itself is important because of the economic and medical impact.

of insects that are agricultural pests and disease vectors as well as positive impact of beneficial species such as the bees and moths responsible for pollination and production of honey The harm or benefit attributable to an insect is a function of what it does that is of its behaviour which is shaped by sensory information Often olfaction is the key modality for control of basic insect behaviour such as orientation and movement toward and interactions with potential mates appropriate sites for oviposition and sources of food Not surprisingly therefore much work on insect olfaction has been motivated by long term hopes of using knowledge of this pivotal sensory system to design strategies for monitoring and managing harmful species and fostering the welfare of beneficial ones
