Natural Capital and Exploitation of the Deep Ocean Maria Baker, Eva Ramirez-Llodra, Paul Tyler, 2020-08-28 The deep ocean is by far the planet's largest biome and holds a wealth of potential natural assets Human exploitation of the deep ocean is rapidly increasing whilst becoming more visible to many through the popular media particularly film and television The scientific literature of deep sea exploitation and its effects has also rapidly expanded as a direct function of this increased national and global interest in exploitation of deep sea resources both biological e.g. fisheries genetic resources and non biological e.g. minerals oil gas methane hydrate At the same time there is a growing interest in deep sea contamination including plastics with many such studies featured in high profile scientific journals and covered by global media outlets However there is currently no comprehensive integration of this information in any form and these topics are only superficially covered in classic textbooks on deep sea biology This concise and accessible work provides an understanding of the relationships between biodiversity and ecosystem functioning both at the seafloor and in the water column and how these might be affected as a result of human interaction exploitation and ultimately environmental change It follows a logical progression from geological and physical processes ecology biology and biogeography to exploitation management and conservation

Natural Capital and Exploitation of the Deep Ocean is aimed at marine biologists and ecologists oceanographers fisheries scientists and managers fish biologists environmental scientists and conservation biologists It will also be of relevance and use to a multi disciplinary audience of fish and wildlife agencies NGOs and government departments involved in deep sea conservation and management

The Open Ocean Pam Walker, Elaine Wood, 2005 A comprehensive resource on the ocean's inhabitants presents living things in their physical habitats emphasizing the relationship between marine biology and marine ecology and the impact humans have on the area

Geodetic Features of the Ocean Surface and their Implications G. Seeber, J.R. Apel, 2013-03-09 This volume contains most of the papers which were presented at the Interdisciplinary Symposium No 4 Geodetic Features of the Ocean Surface and their Implications during the XVIII General Assembly of the International Union of Geodesy and Geophysics IUGG in Hamburg August 1983 The symposium was jointly sponsored by the International Association of Geodesy IAG and the International Association for the Physical Sciences of the Ocean IAPSO and was as such one further step in an important line of international and interdisciplinary symposia related to the field of Marine Geodesy Originally the term Marine Geodesy was widely understood as Geodesy in the Marine Environment and dealt primarily with two aspects precise position determination at sea and determination of a fine structured marine geoid However mainly with the impact of satellite radar altimeter measurements a new understanding began to develop it became evident that the field of Marine Geodesy could not be treated adequately from geodesists alone but that it needed close cooperation with related disciplines such as oceanography and marine geophysics Symposium No 4 at Hamburg could demonstrate that this cooperation has already become a lively reality The geodetic features of the ocean surface don't only reflect oceanographical but also marine geophysical aspects As such scientists from geodesy oceanography marine geology and geophysics came together to present their ideas and to discuss questions of mutual interest

Wastes in Marine Environments, 1988 **Radiological Contamination of the Oceans** United States. Congress. House. Committee on Interior and Insular Affairs. Subcommittee on Energy and the Environment, 1977 Marine Geochemistry Roy Chester, 2012-12-06 The past two or three decades have seen many important advances in our knowledge of the chemistry physics geology and biology of the oceans It has also become apparent that in order to understand the manner in which the oceans work as a chemical system it is necessary to use a framework which takes account of these interdisciplinary advances Marine geochemistry has been written in response to the need for a single state of the art text that addresses the subject of treating the sea water sediment and rock reservoirs as a unified system In taking this approach a process orientated framework has been adopted in which the emphasis is placed on identifying key processes operating within the unified ocean In doing this particular attention has been paid to making the text accessible to students from all disciplines in such a way that future advances can readily be understood I would like to express my thanks to those people who have helped with the writing of this volume In particular I wish to put on record my sincere appreciation of extremely helpful suggestions made by Professor John Edmond FRS In addition I thank Dr S Rowlatt for his comments on the sections covering the geochemistry of oceanic sediments and Dr G Wolff for his invaluable advice on the organic geochemistry of biota water and sediments It is a great pleasure to acknowledge the help of Dr K J T

Deep Convection and Deep Water Formation in the Oceans Simon Chu,J.C. Gascard,1991-09-17 This book contains articles presenting current knowledge about the formation and renewal of deep waters in the ocean These articles were presented at an international workshop at the Naval Postgraduate School in Monterey in March 1990 It is the first book entirely devoted to the topic of deep water formation in which articles have been both selected and reviewed and it is also the first time authors have addressed both surface and deep mixed layers Highlighted are past and recent observations description and analysis concepts and models and modern techniques for future research Thanks to spectacular advances realised in computing sciences over the last twenty years this volume includes a number of sophisticated numerical models Observational as well as theoretical studies are presented and a clear distinction is established between open ocean deep convection and shelf processes both leading to deep and bottom water formation The main subject addressed is the physical mechanism by which the deep water in the ocean can be renewed Ventilation occurs at the surface in areas called the gills where water is mixed and oxygenated before sinking and spreading in the abyss of the deep ocean This phenomenon is a very active area for both experimentalists and theoreticians because of its strong implications for the understanding of the world ocean circulation and Earth climate This major theme sheds light on specific and complex processes happening in very restricted areas still controlling three quarters of the total volume of the ocean All articles include illustrations and a bibliography This book will be of particular interest to physical oceanographers earth scientists environmentalists and climatologists

instructional and content expertise to the tenth edition of Biology The microbial ferrous wheel: iron cycling in terrestrial, freshwater, and marine environments David Emerson, Eric Roden, Benjamin Twining, In the past 15 years there has been steady growth in work relating to the microbial iron cycle It is now well established that in anaerobic environments coupling of organic matter utilization to Fe reduction is a major pathway for anaerobic respiration In iron rich circumneutral environments that exist at oxic anoxic boundaries significant progress has been made in demonstrating that unique groups of microbes can grow either aerobically or anaerobically using Fe as a primary energy source Likewise in high iron acidic environments progress has been made in the study of communities of microbes that oxidize iron and in understanding the details of how certain of these organisms gain energy from Fe oxidation On the iron scarcity side it is now appreciated that in large areas of the open ocean Fe is a key limiting nutrient thus a great deal of research is going into understanding the strategies microbial cells principally phytoplankton use to acquire iron and how the iron cycle may impact other nutrient cycles Finally due to its abundance iron has played an important role in the evolution of Earth's primary biogeochemical cycles through time The aim of this Research Topic is to gather contributions from scientists working in diverse disciplines who have common interests in iron cycling at the process level and at the organismal level both from the perspective of Fe as an energy source or as a limiting nutrient for primary productivity in the ocean The range of disciplines may include geomicrobiologists microbial ecologists microbial physiologists biological oceanographers and biogeochemists Articles can be original research techniques reviews or synthesis papers An overarching goal is to demonstrate the environmental breadth of the iron cycle and foster understanding between different scientific communities who may not always be aware of one another's work
