Industrial High Pressure Applications Rudolf Eggers, 2012-07-11 Industrial high pressure processes open the door to many reactions that are not possible under normal conditions. These are to be found in such different areas as polymerization, catalytic reactions, separations, oil and gas recovery, food processing, biocatalysis, and more. The most famous high pressure process is the so-called Haber-Bosch process, used for fertilizers, and which was awarded a Nobel prize. Following an introduction on historical development, the current state and future trends, this timely and comprehensive publication goes on to describe different industrial processes, including methanol and other catalytic syntheses, polymerization, and renewable energy processes, before covering safety and equipment issues. With its excellent choice of industrial contributions, this handbook offers high quality information not found elsewhere, making it invaluable reading for a broad and interdisciplinary audience.

Gas and Steam Turbine Power Plants S. Can Gülen, 2023-10-19 Featuring real world data and hands on implementable techniques, this is an in depth guide to sustainable electric power generation. *Handbook of Water and Used Water Purification* Josef Lahnsteiner, 2024-03-25 The book addresses the entire water cycle. The focus is on new technologies, processes, especially in high performance biological treatment, energy recovery, water recycling, and reuse. Recommendations with regard to the right technologies, processes for specific situations are provided, and a wide range of case studies, especially in emerging markets. In addition, the most modern water terminology with more positive connotations is used. This is especially important in the field of direct and indirect potable reuse (DPR and IPR respectively). *Heavy Duty Rotating Equipment* Axel Sperber, 2024-07-16 The selection and procurement of compressors and steam turbines for use in the chemical and process industry is highly interdisciplinary. The success of a project is determined by a number of areas of knowledge, from mechanical, electrical, materials, and control engineering, knowledge to thermodynamics, fluid mechanics, and strength theory, through to project management and quality control. In this guide, the individual steps are presented along the chronological chain, together with the basic decisions and pitfalls that need to be taken into account. The work is limited to custom built machines that are specially optimized for a specific process, and to gases and vapours as conveying media. It is presented from the operator's point of view, with a focus on high system availability, safety, and favorable conditions for maintenance and servicing.

Zero Emissions Power Cycles Evgeny Yantovsky, J. Gorski, Mykola Shokotov, 2009-04-23 Focusing on fossil fueled nonpolluting power generation systems, Zero Emissions Power Cycles presents alternative solutions to the severe emissions problems of power plants. Investigation of Gas and Solid Fuel Combustion under Oxy-Fuel Atmosphere Sebastian Bürkle,2019-03-04 Oxy fuel combustion has the potential to reduce the atmospheric CO₂ emissions of fossil fuel power plants by burning gaseous or solid fuels under an atmosphere of carbon dioxide and oxygen The combustion under oxy fuel operating conditions however is accompanied by major changes in the combustion behavior The underlying chemical and physical processes are complex and highly coupled which impedes investigations and modeling Since tactile and most of the optical measurement techniques fail under the sensitive and simultaneously harsh environments of oxy fuel combustion an optical in situ measurement system based on tunable diode laser absorption spectroscopy is developed in this work This system allows to investigate the

thermochemical state of combustion gases with respect to the quantitative concentrations of multiple combustion relevant gases and the gas temperature In combination with a newly developed and applied measurement strategy the system even allows for a measurement of the gas residence time distribution To improve the measurement accuracy multiple absorption line parameters are experimentally determined The measurement system is applied to three oxy fuel combustion systems First the thermochemical state of the laminar non premixed methane combustion under oxy fuel atmosphere is studied The turbulent premixed combustion of the same fuel under air and two oxy fuel atmospheres is studied in a 20 kWth swirled combustor Measurements of the residence time distribution of fluids in the combustion chamber provide insights into mixing and transport properties of the flow The thermochemical state reveals insights into the reaction progress and flow mixing Co firing of three different solid fuels in an assisting gas flame is investigated for a combined thermal power up to 40 kWth Here the char burnout of the particles is investigated The thermochemical state of the combustion of pure torrefied biomass under air and oxy fuel combustion atmosphere is investigated in a 60 kWth close to application facility and compared to equilibrium calculations
