Growth of Crystals E.I.

Givargizov, S.A. Grinberg, 2012-12-06 This volume as the previous ones consists primarily of review articles. However, it also contains a large quantity of original material on the growth of crystals and films. Priority is given to experimental work. Only two articles are concerned exclusively with the theory of crystal growth. Theoretical aspects are treated in several others. This volume is divided into three parts. Part I: Epitaxy and Transformations in Thin Films stems from the current broad application of lasers and optical effects in general to crystal growth in particular the growth of thin films. The first three articles of the book are devoted to this topic. In particular, the laser pulse vaporization method for which a comparatively slow deposition rate is typical, which should not always be viewed as a drawback, is distinguished by the unique kinetics of the initial growth stages. These are not entirely explained. However, this method is completely suitable for oriented or generally ordered growth of films under otherwise equal conditions. Another article of this section is based on use of ultrashort down to picosecond laser pulses. It emphasizes the nonequilibrium processes of crystallization and decrystallization that are characteristic for such influences. In particular, material heated above its melting point and metastable states in the semiconductor melt exhibit these qualities.

Additive Manufacturing Applications for Metals and Composites

Balasubramanian, K.R., Senthilkumar, V., 2020-06-19 Additive manufacturing (AM) of metals and composites using laser energy, direct energy deposition, electron beam methods, and wire arc melting have recently gained importance due to their advantages in fabricating the complex structure. Today, it has become possible to reliably manufacture dense parts with certain AM processes for many materials, including steels, aluminum, and titanium alloys, superalloys, metal-based composites, and ceramic matrix composites. In the near future, the AM material variety will most likely grow further with high performance materials such as intermetallic compounds and high entropy alloys already under investigation. Additive Manufacturing Applications for Metals and Composites is a pivotal reference source that provides vital research on advancing methods and technological developments within additive manufacturing practices. Special attention is paid to the material design of additive manufacturing of parts, the choice of feedstock materials, the metallurgical behavior, and synthesis principle during the manufacturing process, and the resulted microstructures and properties, as well as the relationship between these factors. While highlighting topics such as numerical modeling, intermetallic compounds, and statistical techniques, this publication is ideally designed for students, engineers, researchers, manufacturers, technologists, academicians, practitioners, scholars, and educators.
