The Open Ocean:

Life in the Open Ocean Joseph J. Torres, Thomas G. Bailey, 2022-01-14 *Life in the Open Ocean* The Biology of Pelagic Species provides in depth coverage of the different marine animal groups that form the communities inhabiting the ocean's pelagic realm. This comprehensive resource explores the physical environment, foraging strategies, energetics, locomotion, sensory mechanisms, global and vertical distributions, special adaptations, and other characteristics of a wide array of marine taxa. Bringing together the most recent information available in a single volume, authors Joseph J. Torres and Thomas G. Bailey cover the Cnidaria (stinging jellies), the ctenophores (comb jellies), pelagic nemertean worms, pelagic annelids, crustaceans, cephalopods, and pelagic gastropods, invertebrate chordates, as well as micronekton and larger fishes such as sharks, tunas, mackerels, and mahi mahi. Detailed chapters on each pelagic group describe internal and external anatomy, classification, and history, feeding and digestion, bioluminescent systems and their function, reproduction and development, respiration, excretion, nervous systems, and more. The first book of its kind to address all of the major animal groups comprising both the swimmers and drifters of the open sea, this important resource explains how different animals have adapted to live in the open ocean environment. Covers all sensory mechanisms of animals living in the pelagic habitat, including photoreception, mechanoreception, and chemoreception. Treats the diverse micronekton assemblage as a community. Includes a thorough introduction to the physical oceanography and properties of water in the pelagic realm. *Life in the Open Ocean: The Biology of Pelagic Species* is an excellent senior level undergraduate and graduate textbook for courses in biology and biological oceanography and a valuable reference for all those with interest in open ocean biology. *The Pelagic Environment of the Open Ocean* Martin V. Angel, 2003 Sharks of the Open Ocean Ellen K. Pikitch, 2008 Natural Capital and Exploitation of the Deep Ocean Maria Baker, Eva Ramirez-Llodra, Paul Tyler, 2020-08-28 The deep ocean is by far the planet's largest biome and holds a wealth of potential natural assets. Human exploitation of the deep ocean is rapidly increasing whilst becoming more visible to many through the popular media, particularly film and television. The scientific literature of deep sea exploitation and its effects has also rapidly expanded as a direct function of this increased national and global interest in exploitation of deep sea resources, both biological (e.g. fisheries, genetic resources) and non-biological (e.g. minerals, oil, gas, methane hydrate). At the same time, there is a growing interest in deep sea contamination, including plastics, with many such studies featured in high profile scientific journals and covered by global media outlets. However, there is currently no comprehensive integration of this information in any form, and these topics are only superficially covered in classic textbooks on deep sea biology. This concise and accessible work provides an understanding of the relationships between biodiversity and ecosystem functioning, both at the seafloor and in the water column, and how these might be affected as a result of human interaction, exploitation, and ultimately environmental change. It follows a logical progression from geological and physical processes, ecology, biology, and biogeography to exploitation, management, and conservation.

Natural Capital and Exploitation of the Deep Ocean is aimed at marine biologists and ecologists oceanographers fisheries scientists and managers fish biologists environmental scientists and conservation biologists It will also be of relevance and use to a multi disciplinary audience of fish and wildlife agencies NGOs and government departments involved in deep sea conservation and management

The Open Ocean Pam Walker, Elaine Wood, 2005 A comprehensive resource on the ocean's inhabitants presents living things in their physical habitats emphasizing the relationship between marine biology and marine ecology and the impact humans have on the area

Geodetic Features of the Ocean Surface and their Implications G. Seeber, J.R. Apel, 2013-03-09 This volume contains most of the papers which were presented at the Interdisciplinary Symposium No 4 Geodetic Features of the Ocean Surface and their Implications during the XVIII General Assembly of the International Union of Geodesy and Geophysics IUGG in Hamburg August 1983 The symposium was jointly sponsored by the International Association of Geodesy IAG and the International Association for the Physical Sciences of the Ocean IAPSO and was as such one further step in an important line of international and interdisciplinary symposia related to the field of Marine Geodesy Originally the term Marine Geodesy was widely understood as Geodesy in the Marine Environment and dealt primarily with two aspects precise position determination at sea and determination of a fine structured marine geoid However mainly with the impact of satellite radar altimeter measurements a new understanding began to develop it became evident that the field of Marine Geodesy could not be treated adequately from geodesists alone but that it needed close cooperation with related disciplines such as oceanography and marine geophysics Symposium No 4 at Hamburg could demonstrate that this cooperation has already become a lively reality The geodetic features of the ocean surface don't only reflect oceanographical but also marine geophysical aspects As such scientists from geodesy oceanography marine geology and geophysics came together to present their ideas and to discuss questions of mutual interest

Deep Convection and Deep Water Formation in the Oceans Simon Chu,J.C. Gascard,1991-09-17 This book contains articles presenting current knowledge about the formation and renewal of deep waters in the ocean These articles were presented at an international workshop at the Naval Postgraduate School in Monterey in March 1990 It is the first book entirely devoted to the topic of deep water formation in which articles have been both selected and reviewed and it is also the first time authors have addressed both surface and deep mixed layers Highlighted are past and recent observations description and analysis concepts and models and modern techniques for future research Thanks to spectacular advances realised in computing sciences over the last twenty years this volume includes a number of sophisticated numerical models Observational as well as theoretical studies are presented and a clear distinction is established between open ocean deep convection and shelf processes both leading to deep and bottom water formation The main subject addressed is the physical mechanism by which the deep water in the ocean can be renewed Ventilation occurs at the surface in areas called the gills where water is mixed and oxygenated before sinking and spreading in the abyss of the deep ocean This phenomenon is a very active area for both experimentalists and theoreticians because of its strong implications for the understanding of the world ocean circulation and Earth climate This major theme sheds light on specific and complex processes happening in very restricted areas still controlling three quarters of the total volume of the ocean All articles include illustrations and a bibliography This book will be of particular interest to physical oceanographers earth scientists environmentalists and climatologists

cycling in terrestrial, freshwater, and marine environments David Emerson, Eric Roden, Benjamin Twining, In the past 15 years there has been steady growth in work relating to the microbial iron cycle It is now well established that in anaerobic environments coupling of organic matter utilization to Fe reduction is a major pathway for anaerobic respiration In iron rich circumneutral environments that exist at oxic anoxic boundaries significant progress has been made in demonstrating that unique groups of microbes can grow either aerobically or anaerobically using Fe as a primary energy source Likewise in high iron acidic environments progress has been made in the study of communities of microbes that oxidize iron and in understanding the details of how certain of these organisms gain energy from Fe oxidation On the iron scarcity side it is now appreciated that in large areas of the open ocean Fe is a key limiting nutrient thus a great deal of research is going into understanding the strategies microbial cells principally phytoplankton use to acquire iron and how the iron cycle may impact other nutrient cycles Finally due to its abundance iron has played an important role in the evolution of Earth's primary biogeochemical cycles through time The aim of this Research Topic is to gather contributions from scientists working in diverse disciplines who have common interests in iron cycling at the process level and at the organismal level both from the perspective of Fe as an energy source or as a limiting nutrient for primary productivity in the ocean The range of disciplines may include geomicrobiologists microbial ecologists microbial physiologists biological oceanographers and biogeochemists Articles can be original research techniques reviews or synthesis papers An overarching goal is to demonstrate the environmental breadth of the iron cycle and foster understanding between different scientific communities who may not always be aware of one another's work
