

# Optimizing self-organized study orders: combining refutations and metacognitive prompts improves the use of interleaved practice

Erdem Onan<sup>1</sup>✉, Felicitas Blöwer<sup>2</sup>, Roman Abel<sup>2</sup>, Wisnu Wiradharj<sup>3</sup> & Anique de Bruin<sup>1</sup>

During category learning, students struggle to create an optimal study order: They often study one category at a time (i.e., blocked practice) instead of alternating between different categories (i.e., interleaved practice). Several interventions to improve self-study of categorical learning have been proposed, but these interventions have only been tested in learning tasks where students did not create the study order themselves. Instead, they decided which type of study order to follow. This pre-registered experiment examined whether an intervention that combines refutations and metacognitive prompts can enhance students' engagement in interleaved practice, specifically when they organize the learning materials themselves. Ninety-one undergraduate students were randomized into the intervention and control condition and learned visual categories. Prior to the intervention, students used more blocked practice. After the intervention, the use of interleaved practice significantly increased in both immediate and delayed-transfer tasks. More interleaved practice was associated with better classification performance. Our findings indicate that refutations and metacognitive prompts form a strong intervention that corrects students' erroneous beliefs and increases their engagement in interleaved practice.

To optimize their learning, students should seek out and engage in *desirable difficulties* as much as possible<sup>1</sup>. Desirable difficulties refer to learning conditions (e.g., learning strategies) that require substantial effort in the beginning of a study session and slow down immediate performance, but enhance long-term learning and transfer<sup>2,3</sup>. For example, when students need to re-study a chapter, they could decide whether to test themselves on the chapter questions or to re-read this chapter. While self-testing requires students to invest more effort into learning than simply re-reading<sup>4</sup>, it also leads to better knowledge acquisition and retention<sup>5,6</sup>.

During self-study, however, not all students engage in desirable difficulties<sup>7,8</sup>, indicating that students have difficulties in taking effective control of their learning. For example, one *desirably difficult* strategy that is scarcely utilized by students is interleaved practice<sup>9,10</sup>. This strategy entails that students introduce variability to their study order by alternating between the exemplars of to-be-learned concepts or categories. In medical school, for example, students learn how to diagnose different types of brain

disorders by studying brain images. Interleaved practice requires students to switch between brain images of different disorders (ABCABC) instead of grouping exemplars of the same disorder (AABBCC), called blocked practice. Various studies have encouraged the use of interleaved practice<sup>11–14</sup> because it has the advantage of fostering mental comparison, stimulating retrieval mechanisms, and preparing students to the unpredicted nature of real-life situations.

Interventions to support self-regulated use of interleaved practice have been proposed in previous studies<sup>15–17</sup>. However, these interventions are mainly tested in experimenter-controlled learning tasks, in which experimenters organize exemplars into blocked or interleaved order, and students make one overall decision to choose which order to follow. Such an overall decision provides a behavioral indicator of students' willingness to use interleaved practice but bears little resemblance to everyday life, in which students organize learning materials themselves, by making constant decisions about which material to study next<sup>18,19</sup>. Therefore, it remains unclear a)
