for Environmental Engineers Cristiane Q. Surbeck, Jeff Kuo, 2021-02-25 This book serves as a primary textbook for environmental site investigation and remediation of subsurface soil and groundwater. It introduces concepts and principles of field investigative techniques to adequately determine the extent of contamination in the subsurface for the selection of cleanup alternatives. It then focuses on practical calculations and skills needed to design and operate remediation systems that will both educate students and be useful for entry level professionals in the field. Features: Examines the practical aspects of investigating and cleaning up contaminated soil and groundwater. Contains scenarios, illustrations, equations, and example problems with discussions that illustrate various practical situations and interpret the results. Includes end of chapter problems to reinforce student learning. Provides a regulatory and risk analysis context as well as public and community involvement aspects. Discusses sustainability and performance assessment of the remediation methods presented. Site Assessment and Remediation for Environmental Engineers provides upper level undergraduate and graduate students with practical project oriented knowledge of how to investigate and clean up a site contaminated with chemicals and hazardous waste.

Generating Natural Language Descriptions With Integrated Text and Examples Vibhu O. Mittal, 2022-11-30 This book discusses issues in generating coherent effective natural language descriptions with integrated text and examples. This is done in the context of a system for generating documentation dynamically from the underlying software representations. Good documentation is critical for user acceptance of any complex system. Advances in areas such as knowledge based systems, natural language and multimedia generation now make it possible to investigate the automatic generation of documentation from the underlying knowledge bases. This has several important benefits: it is always accessible, it is always current because the documentation reflects the underlying representation, and it can take the communication context such as the user into account. The work described in this book compiles results from cognitive psychology and education on effective presentation of examples as well as work on computational generation of examples from intelligent tutoring systems. It also takes into account computational learning from examples and a characterization of good examples for just this purpose. Issues arising from these research areas as well as issues coming from the author's own corpus analysis of instructional and explanatory texts are discussed in the context of generating natural language descriptions of software constructs. A text planner is used for a hierarchy of communicative goals. Examples are treated as an integral part of the planning process and their interaction with text is represented at all stages. The strengths and limitations of this approach are also discussed. Although the focus of this book is the generation of natural language descriptions, a similar set of issues need to be addressed in the generation of multimedia descriptions. This book will be of interest to all researchers working in the areas of natural language interfaces, intelligent tutoring systems, documentation and technical writing, and educational psychology.
