**Introduction to**

**Matrices and Vectors** Jacob T. Schwartz, 2012-05-23 Realizing that matrices can be a confusing topic for the beginner the author of this undergraduate text has made things as clear as possible by focusing on problem solving rather than elaborate proofs He begins with the basics offering students a solid foundation for the later chapters on using special matrices to solve problems The first three chapters present the basics of matrices including addition multiplication and division and give solid practice in the areas of matrix manipulation where the laws of algebra do not apply In later chapters the author introduces vectors and shows how to use vectors and matrices to solve systems of linear equations He also covers special matrices including complex numbers quaternion matrices and matrices with complex entries and transpose matrices the trace of a matrix the cross product of matrices eigenvalues and eigenvectors and infinite series of matrices Exercises at the end of each section give students further practice in problem solving Prerequisites include a background in algebra and in the later chapters a knowledge of solid geometry The book was designed as an introductory text for college freshmen and sophomores but selected chapters can also be used to supplement advanced high school classes Professionals who need a better understanding or review of the subject will also benefit from this concise guide

**Hausdorff Spectra in Functional Analysis** Eugeny Smirnov, 2002-08-09 Self contained and collating for the first time material that has until now only been published in journals often in Russian this book will be of interest to functional analysts especially those with interests in topological vector spaces and to algebraists concerned with category theory The closed graph theorem is one of the corner stones of functional analysis both as a tool for applications and as an object for research However some of the spaces which arise in applications and for which one wants closed graph theorems are not of the type covered by the classical closed graph theorem of Banach or its immediate extensions To remedy this mathematicians such as Schwartz and De Wilde in the West and Rajkov in the East have introduced new ideas which have allowed them to establish closed graph theorems suitable for some of the desired applications In this book Professor Smirnov uses category theory to provide a very general framework including the situations discussed by De Wilde Rajkov and others General properties of the spaces involved are discussed and applications are provided in measure theory global analysis and differential equations

**Advances in Disease Vector Research** , 2012-12-06 Entomology plant pathology and virology are a few of the disciplines covered by this well reviewed series It also covers the spectrum of vectors from mosquitos and leafhoppers to nematodes and pathogens from viruses to mycoplasmas to protozoa Articles deal with the emerging science of vector ecology and consider both biotic and abiotic environmental influences on disease transmission As a forum to present current thinking in this field the series is an important resource for researchers and students involved in understanding and overcoming the many vector borne diseases of plants animals and humans
