shares valuable insights into receptor ligand interactions in connection with various biological functions and human diseases. The book discusses a wide range of phylogenetic methods and highlights the applications of Molecular Dynamics Simulation in the drug discovery process. It also explores the application of quantum mechanics in order to provide better accuracy when calculating protein ligand binding interactions and predicting binding affinities. In closing, the book provides illustrative descriptions of major challenges associated with computer aided drug discovery for the development of therapeutic drugs. Given its scope, it offers a valuable asset for life sciences researchers, medicinal chemists, and bioinformaticians looking for the latest information on computer aided methodologies for drug development together with their applications in drug discovery.
