Sticky Sneakers

Goal: To find out how the amount of friction between a sneaker and a surface compare for different types of sneakers.

Background Information: Sneakers are designed to deal with various friction forces including these:

- a) Starting friction, which is involved when you start from a stopped position.
- b) Forward-stopping friction, which is involved when you come to a forward stop.
- c) Sideways-stopping friction, which is involved when you come to a sideways stop.

Today you will investigate the cause and effect of friction on different types of sneakers.

Materials: Two different brands of sneakers, spring scale, mass sets, tape, large paper clips.

Procedure:

1. Hang one sneaker from a spring scale (make sure that the scale is zeroed).
2. Put masses inside the sneaker so that the total mass of the sneaker and the masses is 1000g.
3. In the column labeled "Sneaker," record the type of sneaker (for example: running or basketball).

Starting Friction

4. Place the sneaker with the weights in it in the center of the table.
5. Spread the masses out evenly inside the sneaker.
6. Using tape, attach a paper clip to the **BACK HEEL** of the sneaker (make sure not to place tape on the bottom of the sneaker).
7. Hook the spring scale onto the clip.
8. Pull on the spring scale until the sneaker just starts to move.
9. The force necessary to make the sneaker start moving is equal to the friction force.
10. Record the starting friction force to the nearest Newton in your data table.
