2022 fib Awards for Outstanding Concrete Structures FIB - International Federation for Structural Concrete,2022-06-15 The fib has two major missions now One is to work toward the publication of the Model Code 2020 and the other is to respond to the global movement toward carbon neutrality While the former is steadily progressing toward completion the latter will require significant efforts for generations to come As we all know cement the primary material for concrete is a sector that accounts for 8.5% of the world's CO₂ emissions And the structural concrete that fib handles consume 60% of that In other words we need to know the reality that our structural concrete is emitting 5% of the world's CO₂ From now on fib members suppliers designers builders owner's engineers and academic researchers will be asked how to solve this difficult problem In general most of the CO₂ emissions in the life cycle of structural concrete come from the production stage of materials and the use stage after construction i.e. A1 to A3 and B1 to B5 processes as defined in EN15978 Cement and steel

sectors which are the main materials for structural concrete are expected to take various measures to achieve zero carbon in their respective sectors by 2050. Until then we must deal with the transition with our low carbon technologies. Regarding the production stage, the fib has recently launched TG4.8 Low carbon concrete. And the latest low carbon technologies will be discussed there. On the other hand, in the use stage, there is very little data on the relationship between durability and intervention and maintenance so far. The data accumulation here is the work of the fib, a group of various experts on structural concrete. Through life management using highly durable structures and precise monitoring will enable to realize minimum maintenance in the use stage and to minimize CO₂ emissions. Furthermore, it is also possible to contribute to the reduction of CO₂ emissions in the further stage after the first cycle by responding to the circular economy that is deconstruction, C reuse and recycle, D. However, the technology in this field is still in its infancy and further research and development is expected in the future. As described above, structural concrete can be carbon neutral in all aspects of its conception and it can make a significant contribution when it is realized. The fib will have to address these issues in the future. Of course, it will not be easy and it will take time. However, if we do not continue our efforts as the only international academic society on structural concrete in the world to achieve carbon neutrality, the significance of our very existence may be questioned. Long before Portland cement was invented, Roman concrete made of volcanic ash and other materials was the ultimate low carbon material and is still in use 2 000 years later because of its non-reinforced structure and lack of deterioration factors. Reinforced concrete, which made it possible to apply concrete to structures other than arches and domes, is only 150 years old. Prestressed concrete is even younger with only 80 years of history. Now that we think about it, we realize that Roman concrete, which is non-reinforced low carbon concrete, is one of the examples of problem solving that we are trying to achieve. We have new materials such as coated reinforcement FRP and fiber reinforced concrete, which can be used in any structural form. To overcome this challenge with all our wisdom would be to live up to the feat the Romans accomplished 2 000 years ago. Realizing highly durable and elegant structures with low carbon concrete is the key to meet the demands of the world in the future. I hope you will enjoy reading this AOS brochure showing the Outstanding Concrete Structures Awards at the fib 2022 Congress in Oslo. And I also hope you will find some clues for the challenges we are facing.

Acceptance of Stay Cable Systems Using Prestressing Steels fib Fédération internationale du béton, 2005-01-01

This fib Recommendation gives technical guidelines regarding design testing acceptance installation qualification inspection and maintenance of stay cable systems using prestressing steels strands wires or bars as tensile elements which can be applied internationally This Recommendation is applicable for cable stayed bridges and other suspended structures such as roofs It may also be used for hangers in arch structures and as suspension cables as appropriate This Recommendations has been formulated by an international working group comprising more than 20 experts from administrative authorities universities laboratories owners structural designers suppliers of prestressing steels and stay cable suppliers The text has been written to cover best construction practices around the world and to provide material specifications that are considered to be the most advanced available at the time of preparing this text For ease of use for client designer and cable supplier the complex content has been arranged thematically according to the system components into chapters focusing on performance characteristics requirements and acceptance criteria Requirements and comments have been specified for all parties involved in design and construction in order to aim for a uniform and high quality and durability The interfaces to the structural designer are highlighted The essential subjects are Design and detailing of stay cables including saddles and damping devices Durability requirements and corrosion protection systems Requirements for the materials Testing requirements for the stay cables Installation tolerances qualification of companies and personnel Inspection maintenance and repair This Recommendation does not cover the technology of stay cables whose tensile elements are ropes locked coil cables etc or which consist of composite materials Nevertheless in many cases the specified performance criteria may also be applicable to these systems although numerical values given for the acceptance criteria

may need to be adjusted For these systems it has been difficult to provide multiple protective layers similar to those specified for stay cables made from prestressing steel and therefore the quality of corrosion protection may not be equivalent While extradosed cables have similarities with stay cables generally agreed design and system acceptance criteria are not yet available and therefore this type of cable is not covered
