Abstract

Diabetes mellitus is a major health concern of the originating and developed nations across the world. This devastating disease accounts for the 5% deaths around the globe each year. The current treatment methods do not come up to the underlying causes of the disease and have severe limitations. Stem cells are unique cells with the potential to specialize into whatever case of specialized cells. The different type of stem cells induced pluripotent stem cells (iPSCs), embryonic stem cells (ESCs) and adult stem cells shows to be powerful in treating diabetes with certain restrictions.

Pancreas or islet transplant only provides partial exogenous insulin independence and induces several adverse effects, including increased morbidity and mortality. Mesenchymal stem cells (MSCs) have been envisioned as a promising tool for T1DM treatment over the past few years, since they could differentiate into glucose-responsive insulin-producing cells.

This article precisely reviews the resources and progress gained in the area of stem cell research for diabetic treatment. This review focuses on recent pre-clinical data supporting MSCs use in regenerating β -cell mass and also in treating diabetes. Clinical trial results and the ongoing obstacles which must be addressed regarding the widespread use of such therapy are also discussed.

Keywords: Stem Cell, Diabetes, Mesenchymal stem cell, Clinical therapy

Introduction

Diabetes mellitus (DM) is most devastating, chronic, common non-transmitted illness (NCD) and has become a significant downside globally. The physical structure of the diabetic population around, the planet is frequently increasing with a current estimation of 371 million cases in 2012 and it is anticipated to reach 552 million by 2030 (1). It's additionally calculable that fifth of all deaths within the universe is caused by diabetes and also the range is apace increasing. This polygenic malady is quick gaining the standing of a possible epidemic in India with over sixty two million diabetic people presently diagnosed with the disease (2). It is foretold that by 2030 DM could afflict up to 79.4 million people in India, whereas China (42.3 million) and also the USA (30.3 million) will see important will increase in those laid low with the diabetes. India presently faces associate unsure future in reference to the potential burden that diabetes could impose upon the country.

The chemical ways of treatment for unwellness don't address the causes of the disease and cause facet effects. Thus, in this location is a visible hunt for the appropriate different treatment ways. The present cellular based mostly therapeutic methodology for the treatment of diabetes is aimed along the transplantation of either the duct gland or islet-cells to restructure the hypoglycemic agent secreting purposeful β -cells. Nevertheless, this method is hampered by a lack of donor organs. Of these problems fixed-up the trail to explore the analysis potentialities of generating exocrine gland β -cells from stem cells. The distinctive regenerative properties of stem cells may well be an important tool which might be worked within the discussion of diabetes. This text reviews the progress of the stem cell analysis performed within the space of diabetes treatment and sensible hurdles related to it.
