Kohlmaier, Michael Weber, Richard A. Houghton, 2013-06-29 The Intergovernmental Panel on Climate Change (IPCC) has recently summarized the state of the art in research on climate change. Climate Change 1995: The most up-to-date research findings have been divided into three volumes: the Science of Climate Change, working group I; the Impacts, Adaptation, and Mitigation of Climate Change, working group II; and the Economic and Social Dimensions of Climate Change, working group III. There is a general consensus that a serious change in climate can only be avoided if the future emissions of greenhouse gases are reduced considerably from the business as usual projection and if at the same time the natural sinks for greenhouse gases, in particular that of CO₂, are maintained at the present level or preferably increased. Forests, forestry, and the forestry industry are important parts of the global carbon cycle and therefore they are also part of the mitigation potentials in at least a threefold way. 1. During the time period between 1980 and 1989, there was a net emission of CO₂ from changes in tropical land use, mostly tropical deforestation, of 2.16 GtC a⁻¹, but at the same time it was estimated that the forests in the northern hemisphere have taken up 0.505 GtC a⁻¹ and additionally other terrestrial sinks, including tropical forests where no clearing took place, have been a carbon sink of the order of 1.31 GtC a⁻¹.
