Genetics, Speciation, and the Founder Principle Luther Val Giddings,Kenneth Y. Kaneshiro,Wyatt W. Anderson,1989 This book describes the genetic mechanisms that govern the development and evolution of animals and plants In particular the book focuses on animal and plant species evolving in isolated habitats and species colonizing new territories This approach studying founder populations enables geneticists to more readily identify some of the evolutionary pressures affecting the speciation process The Founder Principle in population genetics was elucidated in large part by Hampton Carson in classic studies of Hawaiian fruit flies *Drosophila* The editors of this volume have commissioned seventeen chapters by an internationally recognized group of geneticists who discuss the principle in relation to plant speciation chromosomal evolution molecular evolution and development sexual selection and genetic changes in natural populations

The Structure and Dynamics of Geographic Ranges Kevin J. Gaston, 2003-05-01 No species occurs everywhere Indeed the majority are absent from most places and where they do occur they are usually quite rare Gaston discusses the structure of these distributions the structure of the geographic ranges of species Gaston is particularly concerned with the factors that determine the limits to a species geographic range how the sizes of those ranges vary and patterns in that variation Also considered are the distribution of individuals amongst those sites where a species does occur and what determines that distribution and some of the practical implications of all these Both in a pure and applied context ecologists need a broader perspective on their subject matter than has historically prevailed This book provides one such perspective A must have book for any researchers and graduate students studying macroecology biogeography and conservation biology
