

Friction is a force that impedes motion by its resistive nature. This resistance will generally oppose the direction of motion causing problems that involve static friction and sliding friction. Most friction is the result of roughness on surfaces that are not moving. Sliding friction is the result of surface resistance.

I. Calculating Friction

In the following topics, a force F^x is applied to an object. This force is related to the distance F^x_d which is:

Let's find the normal force, $F^x_{\perp}$, which is the force pressing the moving object together.

Let's find the equation for finding friction:

Equation:

$$\text{Friction Force (N)} = \mu F^x_{\perp} \quad \text{Coefficient of Friction} \quad \text{Normal Force (N)}$$

In this equation:

- 1) $F^x_{\perp}$ is force of normal
- 2) μ is coefficient of friction
- 3) $F^x_{\perp}$ is normal force which pressing together.

Example: A car is sliding along on a surface which is rough. The coefficient of friction is 0.2. How much friction resistance does the block sliding?

$$\begin{aligned} F^x_{\perp} &= 10 \text{ or } F^x_{\perp} \\ \mu &= 0.2 \text{ (or } \mu) \\ F^x_{\perp} &= 2 \text{ or } 2 \end{aligned}$$

In this example, F^x must be greater than 10 N.

II. Static Friction

Static friction prevents and stops from moving in the direction of the force. This is the force which the surface resists motion.

- 1) A force is applied to the surface which is applied to the surface of a block. The applied force is 10 N. How much static friction force is the surface? How much force is applied to the surface?
