for body movements and protect internal organs Cartilage provides flexible strength and support for body structures such as the thoracic cage the external ear and the trachea and larynx At joints of the body cartilage can also unite adjacent bones or provide cushioning between them Ligaments are the strong connective tissue bands that hold the bones at a moveable joint together and serve to prevent excessive movements of the joint that would result in injury Providing movement of the skeleton are the muscles of the body which are firmly attached to the skeleton via connective tissue structures called tendons As muscles contract they pull on the bones to produce movements of the body Thus without a skeleton you would not be able to stand run or even feed yourself Chapter Outline Divisions of the Skeletal System The Skull The Vertebral Column The Thoracic Cage Embryonic Development of the Axial Skeleton The Open Courses Library introduces you to the best Open Source Courses

bones of the lower limbs are adapted for weight bearing support and stability as well as for body locomotion via walking or running In contrast our upper limbs are not required for these functions Instead our upper limbs are highly mobile and can be utilized for a wide variety of activities The large range of upper limb movements coupled with the ability to easily manipulate objects with our hands and opposable thumbs has allowed humans to construct the modern world in which we live Chapter Outline The Pectoral Girdle Bones of the Upper Limb The Pelvic Girdle and Pelvis Bones of the Lower Limb Development of the Appendicular Skeleton The Open Courses Library introduces you to the best Open Source Courses
