

CHAPTER 8

Cellular respiration: involves the oxidation of organic molecules (usually carbohydrates and lipids) to produce energy (ATP) and release carbon dioxide and water.

ATP: Adenosine Triphosphate (ATP) is the primary energy currency of the cell. It is a nucleotide consisting of a nitrogenous base (Adenine), a ribose sugar, and a phosphate group. The energy is stored in the high-energy bonds between the phosphate groups.

Energy flow: Energy flows from the sun to producers (plants) through photosynthesis. Producers then transfer energy to consumers (animals) through feeding. Energy is lost at each step of the flow, primarily as heat.

Metabolic pathways: These are the series of chemical reactions that occur in the cell to convert nutrients into energy. Key pathways include glycolysis, the citric acid cycle, and the electron transport chain.

Photosynthesis: The process by which plants and some other organisms use light energy to convert carbon dioxide and water into glucose and oxygen.

CHAPTER 9

Prokaryotes: Single-celled organisms that lack a nucleus and other membrane-bound organelles.

Prokaryotes: These organisms lack a nucleus and other membrane-bound organelles. They are typically small and can live in a wide range of environments.

Eukaryotes: These organisms have a nucleus and other membrane-bound organelles. They are typically larger and more complex than prokaryotes.

Prokaryotes and energy: Prokaryotes obtain energy through various means, including photosynthesis, chemosynthesis, and fermentation. They use this energy to power their metabolic processes and growth.
