

CHEMISTRY

Paper 5070/42
Alternative to Practical

Key messages

In calculations, candidates are advised to give their answers to more, rather than fewer, significant figures. Rounding down or rounding up to too few significant figures often leads to answers being given to an insufficient degree of accuracy. If in doubt, candidates should give their answers to a minimum of three significant figures.

Comments on specific questions

Question 1

- (a) Many candidates obviously recognised what the errors were, but found it difficult to express their answers in a clear manner. Common incorrect or insufficient answers included:-
- water in and water out were the wrong way round on the Liebig condenser
 - the thermometer was in the wrong position (without giving a positive statement about what the correct position should be)
 - the flask had a bung in it without reference to which flask the candidate was referring to. (A bung is essential on the distillation flask)
- (b) (i) This was answered well, although "fractionation column", "fractionalating column" or "fractional column" were often seen.
- (ii) The purpose of a fractionating column is separation. Answers occasionally focused on the high surface area of the glass beads rather than concentrating on the purpose of the apparatus.
- (iii) This was usually correct, although condenser was often incorrectly spelt.
- (iv) Some candidates indicated that water is the liquid which collects as the distillate as opposed to being used as a coolant. Others realised that the vapour was being cooled, although there was no reference to the effect of the cooling which was to turn the vapour into a liquid.
- (c) (i) (ii) A large majority of candidates answered both of these parts correctly.
- (d) Candidates should be aware that the majority of organic liquids are flammable and that direct heat from a flame should not be used. Alcohols were occasionally mentioned instead of alkanes. Several suitable alternative methods of heating were suggested by candidates, although uniform heating was often given as the reason instead of flammability.

Question 2

- (a) Many candidates were fully aware of how to carry out a test for nitrates and how to recognise a positive result. Heat was occasionally absent.
- (b) Most candidates gained partial credit for this question. In some cases evaporation to dryness was chosen. Washing the crystals was usually absent. There was no requirement to make the salt or to make the aqueous solution.
- (c) (i) This was answered very well, although a small number of candidates entered the readings the wrong way round.

The 'Creed of Science' in Victorian England Roy M. MacLeod, 2024-10-28 The nineteenth century which saw the triumph of the idea of progress and improvement saw also the triumph of science as a political and cultural force In England as science and its methods claimed privilege and space its language acquired the vocabulary of religion The new creed of science embraced what John Tyndall called the scientific movement it was in the language of T H Huxley a militant creed The march of invention the discoveries of chemistry and the wonders of steam and electricity culminated in a crusade against ignorance and unbelief It was a creed that looked to its own apostolic succession from Copernicus Galileo and the martyrs of the scientific revolution Yet it was a creed whose doctrines were divisive and whose convictions resisted Alongside arguments for materialism utility positivism and evolutionary naturalism persisted reservations about the nature of man the role of ethics and the limits of scientific method These essays discuss leading strategists in the scientific movement of late Victorian England At the same time they show how science established served not only the scientific community but also the interests of imperial and colonial powers
