Neurostimulation: Exploring Perceptual & Cognitive Enhancement Adam Joseph Toth, Mark J. Campbell, Adam Bruton, 2025-08-06 Research investigating the use of electrical or magnetic stimuli to alter the electrophysiology of the central and peripheral nervous systems has flourished in recent years The popularity of these techniques largely stems from their ability to create temporary lesions or enhancements in nervous system function To date a plethora of literature has emerged examining the role of neurostimulation for augmenting motor function due to the relative ease of objectively quantifying changes in behavior performance and even motor evoked potential

amplitudes within individual muscles However the role of neurostimulation in enhancing perceptual and cognitive abilities is under examined and is an area that is now continually gaining research attention Evaluating the role of various forms of neurostimulation on cognitive and perceptual abilities can be challenging due to the lack of control over the underlying neural activity in the central nervous system and the sensitivity with which current measurement tools and tasks quantify cognitive and perceptual functioning This research topic aims to facilitate the publication of high quality methodologically sound research that addresses the quantification and effect that various forms of neurostimulation have on cognitive and perceptual processes across the lifespan In doing so we endeavor to help advance the field of neurostimulation with respect to robustly mapping the effect of neurostimulation on cognitive and perceptual performance
