

## PARTICLE THEORY AND STATES OF MATTER

What is the basic structure of matter? Understanding the nature of matter and the arrangement of particles is fundamental. The arrangement and movement of particles explain various properties of the matter.

**Particle Theory** is the idea that all matter is made up of tiny particles. These particles have three main characteristics:

- 1. Particles are very small.** They are too small to be seen with the naked eye. They can only be seen using a microscope.
- 2. Particles are constantly moving.** They are always in motion. The speed of motion depends on the temperature. Particles move faster at higher temperatures.
- 3. Particles attract each other.** There are forces of attraction between particles. These forces are stronger in solids and weaker in liquids and gases.

**States of Matter** are the different forms that matter can take. They are determined by the temperature and pressure. There are three main states of matter: solid, liquid, and gas.

**Solid:** Particles are packed closely together in a regular arrangement. They have strong forces of attraction between them. They vibrate in fixed positions.

**Liquid:** Particles are packed closely together but can move past each other. They have weaker forces of attraction between them.

**Gas:** Particles are far apart and move freely. They have very weak forces of attraction between them.

**Changes of State** occur when the temperature or pressure of a substance changes. These changes are reversible.

**Melting:** A solid changes into a liquid when the temperature increases. The particles gain enough energy to overcome the strong forces of attraction between them.

**Boiling:** A liquid changes into a gas when the temperature increases. The particles gain enough energy to overcome the forces of attraction between them.

**Condensation:** A gas changes into a liquid when the temperature decreases. The particles lose energy and the forces of attraction between them become stronger.

11. How does the arrangement of particles change when a substance melts? (Can you give examples of substances that do this?)

10. Complete the diagram to show the arrangement of the particles in each state of matter. Also describe the movement of the particles in each state.

9. What is the change of state and what does it mean?

8. What property of matter is demonstrated by the different states of matter? Give examples of the different states of matter.

7. How does the particle theory explain the different states of matter?

1. What is particle theory?

2. List all the states of matter. Describe each state and its properties.

3. How does the particle theory explain the change of state? Give examples of the change of state.

4. The solid state is the most stable state of matter. Explain why. Give examples of the solid state.

5. What are the three states of matter? Give examples of each state.

6. How does the particle theory explain the change of state? Give examples of the change of state.
