*Mesh Methods* Viktor A. Rukavishnikov, Pedro M. Lima, Ildar B. Badriev, 2021-03-29 Mathematical models of various natural processes are described by differential equations systems of partial differential equations and integral equations In most cases the exact solution to such problems cannot be determined therefore one has to use grid methods to calculate an approximate solution using high performance computing systems These methods include the finite element method the finite difference method the finite volume method and combined methods In this Special Issue we bring to your attention works on theoretical studies of grid methods for approximation stability and convergence as well as the results of numerical experiments confirming the effectiveness of the developed methods Of particular interest are new methods for solving boundary value problems with singularities the complex geometry of the domain boundary and nonlinear equations A part of the articles is devoted to the analysis of numerical methods developed for calculating mathematical models in various fields of applied science and engineering applications As a rule the ideas of symmetry are present in the design schemes and make the process harmonious and efficient Advanced Engineering Mathematics Dennis Zill, Warren S.
